Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

**name** The local user/address to assign an alias to

**target** The forwarding address

### 21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
 file.directory

hadoop-0.20-conf:
 alternatives.install:
 - name: hadoop-0.20-conf
 - link: /etc/hadoop-0.20/conf
 - path: {{ my_hadoop_conf }}
 - priority: 30
 - require:
 - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
 alternatives.remove:
 - name: hadoop-0.20-conf
 - path: {{ my_hadoop_conf }}
```

**salt.states.alternatives.auto**(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

**name** is the master name for this link group (e.g. pager)

**salt.states.alternatives.install**(*name, link, path, priority*)

Install new alternative for defined <name>

**name** is the master name for this link group (e.g. pager)

**link** is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

**path** is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

**priority** is an integer; options with higher numbers have higher priority in automatic mode.

**salt.states.alternatives.remove**(*name, path*)

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

**salt.states.alternatives.set\_**(*name, path*)

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

```
foo:
 alternatives.set:
 - path: /usr/bin/foo-2.0
```

## 21.19.4 salt.states.ansiblegate

### Execution of Ansible modules from within states

With *ansible.call* these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```

some_set_of_tasks:
 ansible:
 - system.ping
 - packaging.os.zypper
 - name: emacs
 - state: installed

```

### class salt.states.ansiblegate.AnsibleState

Ansible state caller.

#### get\_args(*argset*)

Get args and kwargs from the argset.

Parameters **argset** –

Returns

salt.states.ansiblegate.**playbooks**(*name, rundir=None, git\_repo=None, git\_kwargs=None, ansible\_kwargs=None*)

Run Ansible Playbooks

Parameters

- **name** – path to playbook. This can be relative to rundir or the git repo
- **rundir** – location to run ansible-playbook from.
- **git\_repo** – git repository to clone for ansible playbooks. This is cloned using the *git.latest* state, and is cloned to the *rundir* if specified, otherwise it is clone to the *cache\_dir*
- **git\_kwargs** – extra kwargs to pass to *git.latest* state module besides the *name* and *target*
- **ansible\_kwargs** – extra kwargs to pass to *ansible.playbooks* execution module besides the *name* and *target*

Returns Ansible playbook output.

```

run nginx install:
 ansible.playbooks:
 - name: install.yml
 - git_repo: git://github.com/gituser/playbook.git
 - git_kwargs:
 rev: master

```

## 21.19.5 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```

/etc/httpd/conf.d/website.com.conf:
 apache.configfile:
 - config:
 - VirtualHost:
 this: '*:80'
 ServerName:
 - website.com
 ServerAlias:
 - www.website.com

```

(continues on next page)

(continued from previous page)

```

- dev.website.com
ErrorLog: logs/website.com-error_log
CustomLog: logs/website.com-access_log combined
DocumentRoot: /var/www/vhosts/website.com
Directory:
 this: /var/www/vhosts/website.com
 Order: Deny,Allow
 Deny from: all
 Allow from:
 - 127.0.0.1
 - 192.168.100.0/24
 Options:
 - Indexes
 - FollowSymlinks
 AllowOverride: All

```

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. <Directory /path/to/dir>).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as <Else>, it still needs keyword `this` with empty string (or `""` if nicer output is required - without space).

```

/etc/httpd/conf.d/website.com.conf:
 apache.configfile:
 - config:
 - VirtualHost:
 - this: '*:80'
 - ServerName:
 - website.com
 - DocumentRoot: /var/www/vhosts/website.com
 - Directory:
 this: /var/www/vhosts/website.com
 Order: Deny,Allow
 Deny from: all
 Allow from:
 - 127.0.0.1
 - 192.168.100.0/24
 Options:
 - Indexes
 - FollowSymlinks
 AllowOverride: All
 - Directory:
 - this: /var/www/vhosts/website.com/private
 - Order: Deny,Allow
 - Deny from: all
 - Allow from:
 - 127.0.0.1
 - 192.168.100.0/24
 - If:
 this: some condition
 do: something
 - Else:
 this:
 do: something else

```

(continues on next page)

(continued from previous page)

```
- Else:
 this: ""
 do: another thing
```

`salt.states.apache.configfile`(*name*, *config*)

## 21.19.6 salt.states.apache\_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
 apache_conf.enabled:
 - name: security

Disable security conf:
 apache_conf.disabled:
 - name: security
```

`salt.states.apache_conf.disabled`(*name*)

Ensure an Apache conf is disabled.

**name** Name of the Apache conf

`salt.states.apache_conf.enabled`(*name*)

Ensure an Apache conf is enabled.

**name** Name of the Apache conf

## 21.19.7 salt.states.apache\_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
 apache_module.enabled:
 - name: cgi

Disable cgi module:
 apache_module.disabled:
 - name: cgi
```

`salt.states.apache_module.disabled`(*name*)

Ensure an Apache module is disabled.

New in version 2016.3.0.

**name** Name of the Apache module

`salt.states.apache_module.enabled`(*name*)

Ensure an Apache module is enabled.

New in version 2016.3.0.

**name** Name of the Apache module

## 21.19.8 salt.states.apache\_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```

Enable default site:
 apache_site.enabled:
 - name: default

Disable default site:
 apache_site.disabled:
 - name: default

```

`salt.states.apache_site.disabled(name)`

Ensure an Apache site is disabled.

**name** Name of the Apache site

`salt.states.apache_site.enabled(name)`

Ensure an Apache site is enabled.

**name** Name of the Apache site

## 21.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.held(name)`

Set package in 'hold' state, meaning it will not be upgraded.

**name** The name of the package, e.g., 'tmux'

## 21.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

---

### Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume

`if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
 archive.extracted:
 - name: /var/www
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
 - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
 archive.extracted:
 - name: /var/www/myapp-16.2.4
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
 archive.extracted:
 - name: /var/www
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

### Important: ZIP Archive Handling

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
 archive.extracted:
 - source: salt://foo/bar/myapp.zip
 - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
 archive.extracted:
 - source: salt://foo/bar/myapp.zip
 - extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

**source\_hash** Hash of source file, or file with list of hash-to-file mappings

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
 archive.extracted:
 - name: /var/www
 - source: https://mydomain.tld/foo.tar.gz
 - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
 archive.extracted:
 - name: /var/www
 - source: https://mydomain.tld/bar.tar.gz
 - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8 ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
archive.extracted:
- source: https://mydomain.tld/dir2/foo.tar.gz
- source_hash: https://mydomain.tld/ashes
- source_hash_name: ./dir2/foo.tar.gz
```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.11.0.

**source\_hash\_update** [False] Set this to `True` if archive should be extracted if `source_hash` has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

**skip\_verify** [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

**keep\_source** [True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

**keep** [True] Same as `keep_source`, kept for backward-compatibility.

---

**Note:** If both `keep_source` and `keep` are used, `keep` will be ignored.

---

**password** For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

**options** For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the `tar/zip` command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

---

**list\_options** For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` "just works". Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

**force** [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

**Warning:** Use this option *very* carefully.

New in version 2016.11.0.

**overwrite** [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean** [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

---

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

---

New in version 2016.11.1.

**user** The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**group** The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**if\_missing** If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

**trim\_output** [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

**use\_cmd\_unzip** [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

**extract\_perms** [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

**enforce\_toplevel** [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

**enforce\_ownership\_on** When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

---

**Note:** This path must be within the path specified by the `name` argument.

---

New in version 2016.11.0.

**archive\_format** One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

### Examples

1. tar with `lmza` (i.e. `xz`) compression:

```
graylog2-server:
 archive.extracted:
 - name: /opt/
 - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
 ↪server-0.9.6p1.tar.lzma
 - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of `user/group` ownership:

```
graylog2-server:
 archive.extracted:
 - name: /opt/
```

(continues on next page)

(continued from previous page)

```

- source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.gz
- source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
- options: v
- user: foo
- group: foo

```

3. tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
 archive.extracted:
 - name: /opt/
 - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
 - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
 - source_hash_update: True

```

### 21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded`(*name*, *artifact*, *target\_dir*='tmp', *target\_file*=None, *use\_literal\_group\_id*=False)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- **artifactory\_url:** URL of the artifactory instance
- **repository:** Repository in artifactory
- **artifact\_id:** Artifact ID
- **group\_id:** Group ID
- **packaging:** Packaging
- **classifier:** Classifier .. **versionadded::** 2015.8.0
- **version:** **Version** One of the following: - Version to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- **username:** Artifactory username .. **versionadded::** 2015.8.0
- **password:** Artifactory password .. **versionadded::** 2015.8.0

**target\_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
 artifactory.downloaded:
 - artifact:
 artifactory_url: http://artifactory.intranet.example.com/artifactory
 repository: 'libs-release-local'
 artifact_id: 'module'
 group_id: 'com.company.module'
 packaging: 'jar'
 classifier: 'sources'
 version: '1.0'
 - target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

jboss_module_downloaded:
artifactory.downloaded:
 - artifact:
 artifactory_url: http://artifactory.intranet.example.com/artifactory
 repository: 'libs-release-local'
 artifact_id: 'module'
 group_id: 'com.company.module'
 packaging: 'jar'
 classifier: 'sources'
 version: '1.0'
 - target_dir: /opt/jboss7/modules/com/company/lib

```

### 21.19.12 salt.states.at

#### Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name*, *jobid=None*, *\*\*kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

**jobid:** `string|int` Specific jobid to remove

**tag** [`string`] Job's tag

**runas** [`string`] Runs user-specified jobs

**kwargs** Addition kwargs can be provided to filter jobs. See output of `at.jobcheck` for more.

```

example1:
at.absent:

```

**Warning:** this will remove all jobs!

```

example2:
at.absent:
 - year: 13

```

```

example3:
at.absent:
 - tag: rose

```

```

example4:
at.absent:
 - tag: rose
 - day: 13
 - hour: 16

```

```

example5:
at.absent:
 - jobid: 4

```

`salt.states.at.mod_watch` (*name*, *\*\*kwargs*)

The at watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly. Parameters for this function should be set by the state being triggered.

---

**name** The name of the atjob

`salt.states.at.present`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique\_tag=False*)  
 Changed in version 2017.7.0.

Add a job to queue.

**job** [string] Command to run.

**timespec** [string] The 'timespec' follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```

rose:
 at.present:
 - job: 'echo "I love saltstack" > love'
 - timespec: '9:09 11/09/13'
 - tag: love
 - user: jam

```

`salt.states.at.watch`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique\_tag=False*)  
 New in version 2017.7.0.

Add an at job if trigger by watch

**job** [string] Command to run.

**timespec** [string] The 'timespec' follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```

minion_restart:
 at.watch:
 - job: 'salt-call --local service.restart salt-minion'
 - timespec: 'now +1 min'
 - tag: minion_restart
 - unique_tag: trye
 - watch:
 - file: /etc/salt/minion

```

### 21.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with `python-augeas`, causing the `augeas` module to fail to import. If the minion has the `augeas` module installed, and the state fails with a comment saying that the state is unavailable, first restart the `salt-minion` service. If the problem

persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change`(*name*, *context=None*, *changes=None*, *lens=None*, *load\_path=None*, *\*\*kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

**name** State name

**context** A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
augeas.change:
- context: /files/etc/redis/redis.conf
- changes:
- set bind 0.0.0.0
- set maxmemory 1G
```

**changes** List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

**lens** The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

**load\_path** A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
augeas.change:
- changes:
- set /files/etc/redis/redis.conf/bind 0.0.0.0
```

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
augeas.change:
- context: /files/etc/redis/redis.conf
- changes:
- set bind 0.0.0.0
- set databases 4
- set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
 augeas.change:
 - lens: redis.lns
 - context: /files/etc/redis/redis.conf
 - changes:
 - set bind 0.0.0.0
```

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
 augeas.change:
 - lens: services.lns
 - context: /files/etc/services
 - changes:
 - ins service-name after service-name[last()]
 - set service-name[last()] "zabbix-agent"
 - set "service-name[. = 'zabbix-agent']/port" 10050
 - set "service-name[. = 'zabbix-agent']/protocol" tcp
 - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
 - rm "service-name[. = 'im-obsolete']"
 - unless: grep "zabbix-agent" /etc/services
```

**Warning:** Don't forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

**Note:** Order is important when defining a service with Augeas, in this case it's `port`, `protocol` and `#comment`. For more info about the lens check [services lens documentation](#).

<http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record>

## 21.19.14 salt.states.aws\_sq3

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```
myqueue:
 aws_sqs.exists:
 - region: eu-west-1
```

`salt.states.aws_sqs.absent` (*name, region, user=None, opts=False*)

Remove the named SQS queue if it exists.

**name** Name of the SQS queue.

**region** Region to remove the queue from

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

`salt.states.aws_sqs.exists` (*name, region, user=None, opts=False*)

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**region** Region to create the queue

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

### 21.19.15 salt.states.azurearm\_compute

Azure (ARM) Compute State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- `azure` >= 2.0.0
- `azure-common` >= 1.1.8
- `azure-mgmt` >= 1.0.0
- `azure-mgmt-compute` >= 1.0.0
- `azure-mgmt-network` >= 1.7.1
- `azure-mgmt-resource` >= 1.1.0
- `azure-mgmt-storage` >= 1.0.0
- `azure-mgmt-web` >= 0.32.0
- `azure-storage` >= 0.34.3
- `msrestazure` >= 0.4.21

**platform** linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`

- password

if using a service principal:

- subscription\_id
- tenant
- client\_id
- secret

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- AZURE\_PUBLIC\_CLOUD (default)
- AZURE\_CHINA\_CLOUD
- AZURE\_US\_GOV\_CLOUD
- AZURE\_GERMAN\_CLOUD

Example Pillar for Azure Resource Manager authentication:

```

azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD

```

Example states using Azure Resource Manager authentication:

```

{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure availability set exists:
 azurearm_compute.availability_set_present:
 - name: my_avail_set
 - resource_group: my_rg
 - virtual_machines:
 - my_vm1
 - my_vm2
 - tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure availability set is absent:
 azurearm_compute.availability_set_absent:
 - name: other_avail_set
 - resource_group: my_rg
 - connection_auth: {{ profile }}

```

`salt.states.azurearm_compute.availability_set_absent` (*name*, *resource\_group*, *connection\_auth=None*)

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

#### Parameters

- **name** – Name of the availability set.
- **resource\_group** – Name of the resource group containing the availability set.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```

salt.states.azurearm_compute.availability_set_present(name, resource_group,
 tags=None, platform_update_domain_count=None,
 platform_fault_domain_count=None,
 virtual_machines=None,
 sku=None, connection_auth=None, **kwargs)

```

New in version 2019.2.0.

Ensure an availability set exists.

#### Parameters

- **name** – Name of the availability set.
- **resource\_group** – The resource group assigned to the availability set.
- **tags** – A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform\_update\_domain\_count** – An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform\_fault\_domain\_count** – An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual\_machines** – A list of names of existing virtual machines to be included in the availability set.
- **sku** – The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure availability set exists:
azurearm_compute.availability_set_present:
 - name: aset1
 - resource_group: group1
 - platform_update_domain_count: 5
 - platform_fault_domain_count: 3
 - sku: aligned
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists

```

## 21.19.16 salt.states.azurearm\_network

Azure (ARM) Network State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- `azure` `>= 2.0.0`
- `azure-common` `>= 1.1.8`
- `azure-mgmt` `>= 1.0.0`
- `azure-mgmt-compute` `>= 1.0.0`
- `azure-mgmt-network` `>= 1.7.1`
- `azure-mgmt-resource` `>= 1.1.0`
- `azure-mgmt-storage` `>= 1.0.0`
- `azure-mgmt-web` `>= 0.32.0`
- `azure-storage` `>= 0.34.3`
- `msrestazure` `>= 0.4.21`

**platform** linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

**if using username and password:**

- `subscription_id`
- `username`
- `password`

**if using a service principal:**

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```

azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD

```

Example states using Azure Resource Manager authentication:

```

{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure virtual network exists:
 azurearm_network.virtual_network_present:
 - name: my_vnet
 - resource_group: my_rg
 - address_prefixes:
 - '10.0.0.0/8'
 - '192.168.0.0/16'
 - dns_servers:
 - '8.8.8.8'
 - tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure virtual network is absent:
 azurearm_network.virtual_network_absent:
 - name: other_vnet
 - resource_group: my_rg
 - connection_auth: {{ profile }}

```

`salt.states.azurearm_network.load_balancer_absent`(*name*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.

#### Parameters

- **name** – Name of the load balancer.
- **resource\_group** – The resource group assigned to the load balancer.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.load_balancer_present`(*name*, *resource\_group*, *sku*=None, *frontend\_ip\_configurations*=None, *backend\_address\_pools*=None, *load\_balancing\_rules*=None, *probes*=None, *inbound\_nat\_rules*=None, *inbound\_nat\_pools*=None, *outbound\_nat\_rules*=None, *tags*=None, *connection\_auth*=None, **\*\*kwargs**)

New in version 2019.2.0.

Ensure a load balancer exists.

#### Parameters

- **name** – Name of the load balancer.
- **resource\_group** – The resource group assigned to the load balancer.
- **sku** – The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** – A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend\_ip\_configurations** – An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **private\_ip\_address**: The private IP address of the IP configuration. Required if 'private\_ip\_allocation\_method' is 'Static'.
  - **private\_ip\_allocation\_method**: The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - **subnet**: Name of an existing subnet inside of which the frontend IP will reside.
  - **public\_ip\_address**: Name of an existing public IP address which will be assigned to the frontend IP object.
- **backend\_address\_pools** – An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probes** – An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **protocol**: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - **port**: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - **interval\_in\_seconds**: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum value is 5.
  - **number\_of\_probes**: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
  - **request\_path**: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.
- **load\_balancing\_rules** – An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **load\_distribution**: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - **frontend\_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.
  - **backend\_port**: The port used for internal connections on the endpoint. Ac-

- `ceptable` values are between 0 and 65535. Note that value 0 enables 'Any Port'.
- `idle_timeout_in_minutes`: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
- `enable_floating_ip`: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- `disable_outbound_snat`: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
- `frontend_ip_configuration`: Name of the frontend IP configuration object used by the load balancing rule object.
- `backend_address_pool`: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- `probe`: Name of the probe object used by the load balancing rule object.
- **inbound\_nat\_rules** - An optional list of dictionaries representing valid `InboundNatRule` objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - `protocol`: Possible values include 'Udp', 'Tcp', or 'All'.
  - `frontend_port`: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - `backend_port`: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - `idle_timeout_in_minutes`: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - `enable_floating_ip`: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- **inbound\_nat\_pools** - An optional list of dictionaries representing valid `InboundNatPool` objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the inbound NAT pool object.
  - `protocol`: Possible values include 'Udp', 'Tcp', or 'All'.
  - `frontend_port_range_start`: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with

- a load balancer. Acceptable values range between 1 and 65534.
- `frontend_port_range_end`: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
- `backend_port`: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.
- **outbound\_nat\_rules** – An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - `name`: The name of the resource that is unique within a resource group.
  - `frontend_ip_configuration`: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - `backend_address_pool`: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - `allocated_outbound_ports`: The number of outbound ports to be used for NAT.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure load balancer exists:
 azurearm_network.load_balancer_present:
 - name: lb1
 - resource_group: group1
 - location: eastus
 - frontend_ip_configurations:
 - name: lb1_feip1
 public_ip_address: pub_ip1
 - backend_address_pools:
 - name: lb1_bepool1
 - probes:
 - name: lb1_webprobe1
 protocol: tcp
 port: 80
 interval_in_seconds: 5
 number_of_probes: 2
 - load_balancing_rules:
 - name: lb1_webprobe1
 protocol: tcp
 frontend_port: 80
 backend_port: 80
 idle_timeout_in_minutes: 4
 frontend_ip_configuration: lb1_feip1
 backend_address_pool: lb1_bepool1
 probe: lb1_webprobe1
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists
 - azurearm_network: Ensure public IP exists

```

`salt.states.azurearm_network.network_interface_absent` (*name, resource\_group, connection\_auth=None*)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

**Parameters**

- **name** – Name of the network interface.
- **resource\_group** – The resource group assigned to the network interface.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.network_interface_present(name, ip_configurations,
 subnet, virtual_network,
 resource_group, tags=None,
 virtual_machine=None, net-
 work_security_group=None,
 dns_settings=None,
 mac_address=None,
 primary=None, enable_
 accelerated_networking=None,
 enable_ip_forwarding=None,
 connection_auth=None,
 **kwargs)
```

New in version 2019.2.0.

Ensure a network interface exists.

**Parameters**

- **name** – Name of the network interface.
- **ip\_configurations** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – Name of the existing subnet assigned to the network interface.
- **virtual\_network** – Name of the existing virtual network containing the subnet.
- **resource\_group** – The resource group assigned to the virtual network.
- **tags** – A dictionary of strings can be passed as tag metadata to the network interface object.
- **network\_security\_group** – The name of the existing network security group to assign to the network interface.
- **virtual\_machine** – The name of the existing virtual machine to assign to the network interface.
- **dns\_settings** – An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - **dns\_servers**: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns\_servers collection.
  - **internal\_dns\_name\_label**: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - **internal\_fqdn**: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - **internal\_domain\_name\_suffix**: Even if internal\_dns\_name\_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal\_domain\_name\_suffix.
- **mac\_address** – Optional string containing the MAC address of the network interface.
- **primary** – Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.
- **enable\_accelerated\_networking** – Optional boolean indicating whether accelerated networking should be enabled for the interface.

- **enable\_ip\_forwarding** – Optional boolean indicating whether IP forwarding should be enabled for the interface.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure network interface exists:
 azurearm_network.network_interface_present:
 - name: iface1
 - subnet: vnet1_sn1
 - virtual_network: vnet1
 - resource_group: group1
 - ip_configurations:
 - name: iface1_ipc1
 public_ip_address: pub_ip2
 - dns_settings:
 internal_dns_name_label: decisionlab-int-test-label
 - primary: True
 - enable_accelerated_networking: True
 - enable_ip_forwarding: False
 - network_security_group: nsg1
 - connection_auth: {{ profile }}
 - require:
 - azurearm_network: Ensure subnet exists
 - azurearm_network: Ensure network security group exists
 - azurearm_network: Ensure another public IP exists

```

`salt.states.azurearm_network.network_security_group_absent` (*name*, *resource\_group*, *connection\_auth=None*)

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

#### Parameters

- **name** – Name of the network security group.
- **resource\_group** – The resource group assigned to the network security group.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.network_security_group_present` (*name*, *resource\_group*, *tags=None*, *security\_rules=None*, *connection\_auth=None*, *\*\*kwargs*)

New in version 2019.2.0.

Ensure a network security group exists.

#### Parameters

- **name** – Name of the network security group.
- **resource\_group** – The resource group assigned to the network security group.
- **tags** – A dictionary of strings can be passed as tag metadata to the network security group object.
- **security\_rules** – An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the `security_rule_present` state or `security_rule_create_or_update` execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter

is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.

- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure network security group exists:
 azurearm_network.network_security_group_present:
 - name: nsg1
 - resource_group: group1
 - security_rules:
 - name: nsg1_rule1
 priority: 100
 protocol: tcp
 access: allow
 direction: outbound
 source_address_prefix: virtualnetwork
 destination_address_prefix: internet
 source_port_range: '*'
 destination_port_range: '*'
 - name: nsg1_rule2
 priority: 101
 protocol: tcp
 access: allow
 direction: inbound
 source_address_prefix: internet
 destination_address_prefix: virtualnetwork
 source_port_range: '*'
 destination_port_ranges:
 - '80'
 - '443'
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists

```

`salt.states.azurearm_network.public_ip_address_absent` (*name*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

#### Parameters

- **name** – Name of the public IP address.
- **resource\_group** – The resource group assigned to the public IP address.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.public_ip_address_present` (*name*, *resource\_group*, *tags*=None, *sku*=None, *public\_ip\_allocation\_method*=None, *public\_ip\_address\_version*=None, *dns\_settings*=None, *idle\_timeout\_in\_minutes*=None, *connection\_auth*=None, **\*\*kwargs**)

New in version 2019.2.0.

Ensure a public IP address exists.

#### Parameters

- **name** – Name of the public IP address.
- **resource\_group** – The resource group assigned to the public IP address.
- **dns\_settings** – An optional dictionary representing a valid PublicIPAddressDns-Settings object. Parameters include 'domain\_name\_label' and 'reverse\_fqdn', which accept strings. The 'domain\_name\_label' parameter is concatenated with the regionalized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse\_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- **sku** – The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public\_ip\_allocation\_method** – The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public\_ip\_address\_version** – The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle\_timeout\_in\_minutes** – An integer representing the idle timeout of the public IP address.
- **tags** – A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure public IP exists:
 azurearm_network.public_ip_address_present:
 - name: pub_ip1
 - resource_group: group1
 - dns_settings:
 domain_name_label: decisionlab-ext-test-label
 - sku: basic
 - public_ip_allocation_method: static
 - public_ip_address_version: ipv4
 - idle_timeout_in_minutes: 4
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists

```

`salt.states.azurearm_network.route_absent`(*name*, *route\_table*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

#### Parameters

- **name** – Name of the route table.
- **route\_table** – The name of the existing route table containing the route.
- **resource\_group** – The resource group assigned to the route table.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.route_present(name, address_prefix, next_hop_type,
 route_table, resource_group,
 next_hop_ip_address=None,
 connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a route exists within a route table.

#### Parameters

- **name** – Name of the route.
- **address\_prefix** – The destination CIDR to which the route applies.
- **next\_hop\_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next\_hop\_ip\_address** – The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route\_table** – The name of the existing route table which will contain the route.
- **resource\_group** – The resource group assigned to the route table.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route exists:
azurearm_network.route_present:
- name: rt1_route2
- route_table: rt1
- resource_group: group1
- address_prefix: '192.168.0.0/16'
- next_hop_type: vnetlocal
- connection_auth: {{ profile }}
- require:
 - azurearm_network: Ensure route table exists
```

```
salt.states.azurearm_network.route_table_absent(name, resource_group,
 connection_auth=None)
```

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

#### Parameters

- **name** – Name of the route table.
- **resource\_group** – The resource group assigned to the route table.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.route_table_present(name, resource_group,
 tags=None, routes=None,
 disable_bgp_route_propagation=None,
 connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a route table exists.

#### Parameters

- **name** – Name of the route table.
- **resource\_group** – The resource group assigned to the route table.
- **routes** – An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the `route_present` state or `route_create_or_update` execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present.

When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.

- **disable\_bgp\_route\_propagation** – An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
- **tags** – A dictionary of strings can be passed as tag metadata to the route table object.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure route table exists:
 azurearm_network.route_table_present:
 - name: rt1
 - resource_group: group1
 - routes:
 - name: rt1_route1
 address_prefix: '0.0.0.0/0'
 next_hop_type: internet
 - name: rt1_route2
 address_prefix: '192.168.0.0/16'
 next_hop_type: vnetlocal
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists

```

`salt.states.azurearm_network.security_rule_absent`(*name*, *security\_group*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

#### Parameters

- **name** – Name of the security rule.
- **security\_group** – The network security group containing the security rule.
- **resource\_group** – The resource group assigned to the network security group.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.security_rule_present`(*name*, *access*, *direction*, *priority*, *protocol*, *security\_group*, *resource\_group*, *destination\_address\_prefix*=None, *destination\_port\_range*=None, *source\_address\_prefix*=None, *source\_port\_range*=None, *description*=None, *destination\_address\_prefixes*=None, *destination\_port\_ranges*=None, *source\_address\_prefixes*=None, *source\_port\_ranges*=None, *connection\_auth*=None, *\*\*kwargs*)

New in version 2019.2.0.

Ensure a security rule exists.

#### Parameters

- **name** – Name of the security rule.

- **access** – 'allow' or 'deny'
- **direction** – 'inbound' or 'outbound'
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – 'tcp', 'udp', or '\*'
- **security\_group** – The name of the existing network security group to contain the security rule.
- **resource\_group** – The resource group assigned to the network security group.
- **description** – Optional description of the security rule.
- **destination\_address\_prefix** – The CIDR or destination IP range. Asterix '\*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination\_port\_range** – The destination port or range. Integer or range between 0 and 65535. Asterix '\*' can also be used to match all ports.
- **source\_address\_prefix** – The CIDR or source IP range. Asterix '\*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source\_port\_range** – The source port or range. Integer or range between 0 and 65535. Asterix '\*' can also be used to match all ports.
- **destination\_address\_prefixes** – A list of destination\_address\_prefix values. This parameter overrides destination\_address\_prefix and will cause any value entered there to be ignored.
- **destination\_port\_ranges** – A list of destination\_port\_range values. This parameter overrides destination\_port\_range and will cause any value entered there to be ignored.
- **source\_address\_prefixes** – A list of source\_address\_prefix values. This parameter overrides source\_address\_prefix and will cause any value entered there to be ignored.
- **source\_port\_ranges** – A list of source\_port\_range values. This parameter overrides source\_port\_range and will cause any value entered there to be ignored.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure security rule exists:
 azurearm_network.security_rule_present:
 - name: nsg1_rule2
 - security_group: nsg1
 - resource_group: group1
 - priority: 101
 - protocol: tcp
 - access: allow
 - direction: inbound
 - source_address_prefix: internet
 - destination_address_prefix: virtualnetwork
 - source_port_range: '*'
 - destination_port_ranges:
 - '80'
 - '443'
 - connection_auth: {{ profile }}
 - require:
 - azurearm_network: Ensure network security group exists

```

`salt.states.azurearm_network.subnet_absent`(*name*, *virtual\_network*, *resource\_group*, *connection\_auth=None*)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

#### Parameters

- **name** – Name of the subnet.
- **virtual\_network** – Name of the existing virtual network containing the subnet.
- **resource\_group** – The resource group assigned to the virtual network.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```

salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network,
 resource_group, security_group=None,
 route_table=None, connection_auth=None,
 **kwargs)

```

New in version 2019.2.0.

Ensure a subnet exists.

#### Parameters

- **name** – Name of the subnet.
- **address\_prefix** – A CIDR block used by the subnet within the virtual network.
- **virtual\_network** – Name of the existing virtual network to contain the subnet.
- **resource\_group** – The resource group assigned to the virtual network.
- **security\_group** – The name of the existing network security group to assign to the subnet.
- **route\_table** – The name of the existing route table to assign to the subnet.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure subnet exists:
azurearm_network.subnet_present:
- name: vnet1_sn1
- virtual_network: vnet1
- resource_group: group1
- address_prefix: '192.168.1.0/24'
- security_group: nsg1
- route_table: rtl
- connection_auth: {{ profile }}
- require:
- azurearm_network: Ensure virtual network exists
- azurearm_network: Ensure network security group exists
- azurearm_network: Ensure route table exists

```

```

salt.states.azurearm_network.virtual_network_absent(name, resource_group, connec-
 tion_auth=None)

```

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

#### Parameters

- **name** – Name of the virtual network.
- **resource\_group** – The resource group assigned to the virtual network.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.virtual_network_present(name, address_prefixes,
 resource_group,
 dns_servers=None, tags=None,
 connection_auth=None,
 **kwargs)
```

New in version 2019.2.0.

Ensure a virtual network exists.

#### Parameters

- **name** – Name of the virtual network.
- **resource\_group** – The resource group assigned to the virtual network.
- **address\_prefixes** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **dns\_servers** – A list of DNS server addresses.
- **tags** – A dictionary of strings can be passed as tag metadata to the virtual network object.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure virtual network exists:
azurearm_network.virtual_network_present:
- name: vnet1
- resource_group: group1
- address_prefixes:
 - '10.0.0.0/8'
 - '192.168.0.0/16'
- dns_servers:
 - '8.8.8.8'
- tags:
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}
- require:
 - azurearm_resource: Ensure resource group exists
```

## 21.19.17 salt.states.azurearm\_resource

Azure (ARM) Resource State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0

- `azure-mgmt-web` `>= 0.32.0`
- `azure-storage` `>= 0.34.3`
- `msrestazure` `>= 0.4.21`

#### platform linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure resource group exists:
 azurearm_resource.resource_group_present:
 - name: my_rg
```

(continues on next page)

(continued from previous page)

```

- location: westus
- tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}

Ensure resource group is absent:
azurearm_resource.resource_group_absent:
- name: other_rg
- connection_auth: {{ profile }}

```

`salt.states.azurearm_resource.policy_assignment_absent`(*name*, *scope*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a policy assignment does not exist in the provided scope.

#### Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.

**connection\_auth** A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_resource.policy_assignment_present`(*name*, *scope*, *definition\_name*, *display\_name*=None, *description*=None, *assignment\_type*=None, *parameters*=None, *connection\_auth*=None, *\*\*kwargs*)

New in version 2019.2.0.

Ensure a security policy assignment exists.

#### Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.
- **definition\_name** – The name of the policy definition to assign.
- **display\_name** – The display name of the policy assignment.
- **description** – The policy assignment description.
- **assignment\_type** – The type of policy assignment.
- **parameters** – Required dictionary if a parameter is used in the policy rule.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure policy assignment exists:
azurearm_resource.policy_assignment_present:
- name: testassign
- scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
- definition_name: testpolicy
- display_name: Test Assignment
- description: Test assignment for testing assignments.
- connection_auth: {{ profile }}

```

`salt.states.azurearm_resource.policy_definition_absent`(*name*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

#### Parameters

- **name** – Name of the policy definition.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_resource.policy_definition_present(name, policy_rule=None,
 policy_type=None,
 mode=None, dis-
 play_name=None,
 description=None,
 metadata=None, pa-
 rameters=None, pol-
 icy_rule_json=None,
 policy_rule_file=None,
 template='jinja',
 source_hash=None,
 source_hash_name=None,
 skip_verify=False, con-
 nexion_auth=None,
 **kwargs)
```

New in version 2019.2.0.

Ensure a security policy definition exists.

#### Parameters

- **name** – Name of the policy definition.
- **policy\_rule** – A YAML dictionary defining the policy rule. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
- **policy\_rule\_json** – A text field defining the entirety of a policy definition in JSON. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **policy\_rule\_file** – The source of a JSON file defining the entirety of a policy definition. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **skip\_verify** – Used for the `policy_rule_file` parameter. If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.
- **source\_hash** – This can be a source hash string or the URI of a file that contains source hash strings.
- **source\_hash\_name** – When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.
- **policy\_type** – The type of policy definition. Possible values are `NotSpecified`, `BuiltIn`, and `Custom`. Only used with the `policy_rule` parameter.
- **mode** – The policy definition mode. Possible values are `NotSpecified`, `Indexed`, and `All`. Only used with the `policy_rule` parameter.
- **display\_name** – The display name of the policy definition. Only used with the `policy_rule` parameter.
- **description** – The policy definition description. Only used with the

- **policy\_rule** parameter.
- **metadata** – The policy definition metadata defined as a dictionary. Only used with the `policy_rule` parameter.
- **parameters** – Required dictionary if a parameter is used in the policy rule. Only used with the `policy_rule` parameter.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure policy definition exists:
 azurearm_resource.policy_definition_present:
 - name: testpolicy
 - display_name: Test Policy
 - description: Test policy for testing policies.
 - policy_rule:
 if:
 allOf:
 - equals: Microsoft.Compute/virtualMachines/write
 source: action
 - field: location
 in:
 - eastus
 - eastus2
 - centralus
 then:
 effect: deny
 - connection_auth: {{ profile }}

```

`salt.states.azurearm_resource.resource_group_absent`(*name*, *connection\_auth=None*)  
New in version 2019.2.0.

Ensure a resource group does not exist in the current subscription.

#### Parameters

- **name** – Name of the resource group.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_resource.resource_group_present`(*name*, *location*, *managed\_by=None*, *tags=None*, *connection\_auth=None*, *\*\*kwargs*)

New in version 2019.2.0.

Ensure a resource group exists.

#### Parameters

- **name** – Name of the resource group.
- **location** – The Azure location in which to create the resource group. This value cannot be updated once the resource group is created.
- **managed\_by** – The ID of the resource that manages this resource group. This value cannot be updated once the resource group is created.
- **tags** – A dictionary of strings can be passed as tag metadata to the resource group object.
- **connection\_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure resource group exists:
 azurearm_resource.resource_group_present:

```

(continues on next page)

(continued from previous page)

```

- name: group1
- location: eastus
- tags:
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}

```

## 21.19.18 salt.states.beacon

### Management of the Salt beacons

New in version 2015.8.0.

```

ps:
 beacon.present:
 - save: True
 - enable: False
 - services:
 salt-master: running
 apache2: stopped

sh:
 beacon.present: []

load:
 beacon.present:
 - averages:
 1m:
 - 0.0
 - 2.0
 5m:
 - 0.0
 - 1.5
 15m:
 - 0.1
 - 1.0

```

**salt.states.beacon.absent**(*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is absent.

**name** The name of the beacon ensured absent.

**save** True/False, if True the beacons.conf file be updated too. Default is False.

**salt.states.beacon.disabled**(*name*, *\*\*kwargs*)

Disable a beacon.

**name** The name of the beacon to disable.

**salt.states.beacon.enabled**(*name*, *\*\*kwargs*)

Enable a beacon.

**name** The name of the beacon to enable.

**salt.states.beacon.present**(*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is configured with the included beacon data.

**name** The name of the beacon ensure is configured.

**save** True/False, if True the beacons.conf file be updated too. Default is False.

### 21.19.19 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

`maturity` develop

`platform` f5\_bigip\_11.6

`salt.states.bigip.add_pool_member` (*hostname, username, password, name, member*)

A function to connect to a bigip device and add a new member to an existing pool.

`hostname` The host/address of the bigip device

`username` The iControl REST username

`password` The iControl REST password

`name` The name of the pool to modify

`member` The member to add to the pool

`salt.states.bigip.create_monitor` (*hostname, username, password, monitor\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a monitor.

`hostname` The host/address of the bigip device

`username` The iControl REST username

`password` The iControl REST password

`monitor_type` The type of monitor to create

`name` The name of the monitor to create

`kwargs` [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node` (*hostname, username, password, name, address*)

Create a new node if it does not already exist.

`hostname` The host/address of the bigip device

`username` The iControl REST username

`password` The iControl REST password

`name` The name of the node to create

`address` The address of the node

`salt.states.bigip.create_pool` (*hostname, username, password, name, members=None, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

Create a new node if it does not already exist.

`hostname` The host/address of the bigip device

`username` The iControl REST username

`password` The iControl REST password

`name` The name of the pool to create

`members` List of members to be added to the pool

`allow_nat` [yes | no]

`allow_snat` [yes | no]

`description` [string]

`gateway_failsafe_device` [string]

**ignore\_persisted\_weight** [enabled | disabled]

`salt.states.bigip.create_profile` (*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters |, , and : must be escaped using \ when used within strings.

`salt.states.bigip.create_virtual` (*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, virtual\_state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

A function to connect to a bigip device and create a virtual server if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual to create

`salt.states.bigip.delete_monitor` (*hostname, username, password, monitor\_type, name*)

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.delete_node(hostname, username, password, name)`

Delete an existing node.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node which will be deleted.

`salt.states.bigip.delete_pool(hostname, username, password, name)`

Delete an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool which will be deleted

`salt.states.bigip.delete_pool_member(hostname, username, password, name, member)`

Delete an existing pool member.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to be modified

**member** The name of the member to delete from the pool

`salt.states.bigip.delete_profile(hostname, username, password, profile_type, name)`

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.delete_virtual(hostname, username, password, name)`

Delete an existing virtual.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the virtual which will be deleted

`salt.states.bigip.list_monitor(hostname, username, password, monitor_type, name)`

A function to list an existing monitor.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to list

**name** The name of the monitor to list

`salt.states.bigip.list_node(hostname, username, password, name)`

A function to connect to a bigip device and list a specific node.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to list.

`salt.states.bigip.list_pool(hostname, username, password, name)`

A function to connect to a bigip device and list a specific pool.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to list.

`salt.states.bigip.list_profile(hostname, username, password, profile_type, name)`

A function to list an existing profile.  
**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to list  
**name** The name of the profile to list

`salt.states.bigip.list_virtual(hostname, username, password, name)`

A function to list a specific virtual.  
**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to list

`salt.states.bigip.manage_monitor(hostname, username, password, monitor_type, name, **kwargs)`

Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create  
**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)`

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to manage.  
**address** The address of the node  
**connection\_limit** [integer]  
**description** [string]  
**dynam c\_ratio**: [integer]  
**logging** [enabled | disabled]  
**monitor** [[name] | none | default]  
**rate\_limit** [integer]  
**ratio** [integer]  
**session** [user-enabled | user-disabled]  
**node\_state (state)** [user-down | user-up ]

```

salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**service\_down\_action** [drop | none | reselect | reset]

**slow\_ramp\_time** [integer]

```

salt.states.bigip.manage_pool_members(hostname, username, password, name, members)

```

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**members** list of pool members to manage.

```

salt.states.bigip.manage_profile(hostname, username, password, profile_type, name, **kwargs)

```

Create a new profile if a monitor of this type and name does not already exists. If it does exist, only the

parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

```
salt.states.bigip.manage_virtual(hostname, username, password, name, destination,
pool=None, address_status=None, auto_lasthop=None,

```

`salt.states.bigip.modify_monitor`(*hostname*, *username*, *password*, *monitor\_type*, *name*,  
\*\**kwargs*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.modify_node`(*hostname*, *username*, *password*, *name*, *connection\_limit=None*,  
*description=None*, *dynamic\_ratio=None*, *logging=None*, *monitor=None*, *rate\_limit=None*, *ratio=None*, *session=None*,  
*node\_state=None*)

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to modify

**connection\_limit** [integer]

**description** [string]

**dynamic\_ratio** [integer]

### 21.19.20 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
 blockdev.tuned:
 - read-only: True

master-data:
 blockdev.tuned:
 - name: /dev/vg/master-data
 - read-only: True
 - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.formatted` (*name*, *fs\_type*='ext4', *force*=False, *\*\*kwargs*)

Manage filesystems of partitions.

**name** The name of the block device

**fs\_type** The filesystem it should be formatted as

**force** Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned(name, **kwargs)`

Manage options of block device

**name** The name of the block device

**opts:**

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

## 21.19.21 salt.states.boto3\_elasticache module

### Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use <http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html> as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure myelasticache exists:
 boto3_elasticache.present:
 - name: myelasticache
```

(continues on next page)

(continued from previous page)

```

- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdjfjkgHwupUjasdfldkdfklgjsdfjajkghs

```

```
Using a profile from pillars
```

```
Ensure myelasticache exists:
```

```
boto3_elasticache.present:
```

```

- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile: myprofile

```

```
Passing in a profile
```

```
Ensure myelasticache exists:
```

```
boto3_elasticache.present:
```

```

- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdjfjkgHwupUjasdfldkdfklgjsdfjajkghs

```

```

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None,
 key=None, keyid=None, profile=None, **args)

```

Ensure a given cache cluster is deleted.

**name** Name of the cache cluster.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**CacheClusterId** The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**FinalSnapshotIdentifier** The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure a given cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**CacheClusterId** The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupId** The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

---

**Note:** This parameter is ONLY supported for Memcached cache clusters.

---

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

---

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

---

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

---

**Note:** For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

---

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at <https://aws.amazon.com/elasticache/pricing/>

---

**Note:**

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

---

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

**CacheSubnetGroupName** The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

---

**CacheSecurityGroupNames** A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds** One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**SnapshotName** The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The

---

minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port** The port number on which each of the cache nodes accepts connections.

Default: 6379

**NotificationTopicArn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

---

**Note:** The Amazon SNS topic owner must be the same as the cache cluster owner.

---

**AutoMinorVersionUpgrade** This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**AuthToken** The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

**CacheNodeIdsToRemove** A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

**NewAvailabilityZones** The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

**NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None,
 key=None, keyid=None,
 profile=None, **args)
```

Ensure a given cache subnet group is deleted.

**name** Name of the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None,
 region=None, key=None,
 keyid=None, profile=None,
 **args)
```

Ensure cache subnet group exists.

**name** A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

**subnets** A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**CacheSubnetGroupDescription** A description for the cache subnet group.

**SubnetIds** A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, re-
 gion=None, key=None,
 keyid=None, profile=None,
 **args)
```

Ensure a given replication group is deleted.

**name** Name of the replication group.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId** The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**RetainPrimaryCluster** If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier** The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure a replication group exists and is in the given state.

**name** Name of replication group

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**ReplicationGroupId** The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupDescription** A user-created description for the replication group.

**PrimaryClusterId** The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

---

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
  - Redis (cluster mode disabled): T1 and T2 node types.
  - Redis (cluster mode enabled): T2 node types.
- 

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

---

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only

locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

---

**NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

**ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

**NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fidly details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create\\_replication\\_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group)

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See <https://aws.amazon.com/elasticache/pricing/> for current sizing, prices, and constraints.

**Engine** The name of the cache engine to be used for the cache clusters in this replication group.

**EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

**CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

---

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

---

**CacheSubnetGroupName** The name of the cache subnet group to be used for the replication group.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a s group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

---

**CacheSecurityGroupNames** A list of cache security group names to associate with this replication group.

**SecurityGroupIds** One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**SnapshotName** The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port** The port number on which each member of the replication group accepts connections.

**NotificationTopicArn** The ARN of an SNS topic to which notifications are sent.

---

**Note:** The SNS topic owner must be the same as the cache cluster owner.

---

**AutoMinorVersionUpgrade** This parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**AuthToken** The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

**SnapshottingClusterId** The cache cluster ID that is used as the daily snapshot source for the replication group.

**NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.22 salt.states.boto3\_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
 region: us-east-1
```

#### An exciting new AWS Route 53 Hosted Zone:

```
boto_route53.hosted_zone_present:
 - Name: example.com.
 - PrivateZone: true
 - VPCs:
 - VPCName: MyLittleVPC
 VPCRegion: us-east-1
 - VPCId: vpc-12345678
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

#### mycnamerecord:

```
boto_route53.rr_present:
 - Name: test.example.com.
 - ResourceRecords:
 - my-elb.us-east-1.elb.amazonaws.com.
 - DomainName: example.com.
 - TTL: 60
 - Type: CNAME
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

`salt.states.boto3_route53.hosted_zone_absent` (*name*, *Name=None*, *PrivateZone=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

**PrivateZone** Set True if deleting a private hosted zone.

`salt.states.boto3_route53.hosted_zone_present` (*name*, *Name=None*, *PrivateZone=False*, *CallerReference=None*, *Comment=None*, *VPCs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes.

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from

your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

**PrivateZone** Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

**Comment** Any comments you want to include about the hosted zone.

**CallerReference** A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs** A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

**VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for VPCRegion.

```

salt.states.boto3_route53.rr_absent(name, HostedZoneId=None, DomainName=None, Private-
 Zone=False, Name=None, Type=None, SetIdentifier=None,
 region=None, key=None, keyid=None, profile=None)

```

Ensure the Route53 record is deleted.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName** The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the RR to be removed is in a private zone, False if public.

**Name** Name of the resource record.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

```

salt.states.boto3_route53.rr_present(name, HostedZoneId=None, DomainName=None,
 PrivateZone=False, Name=None, Type=None, SetIden-
 tifier=None, Weight=None, Region=None, GeoLoca-
 tion=None, Failover=None, TTL=None, ResourceRe-
 cords=None, AliasTarget=None, HealthCheckId=None,
 TrafficPolicyInstanceId=None, region=None, key=None,
 keyid=None, profile=None)

```

Ensure the Route53 record is present.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of a zone to create the record in. Exclusive with DomainName.

**DomainName** The domain name of a zone to create the record in. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the resource record should be in a private zone, False if public.

**Name** Name of the Route 53 resource record being managed.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier

that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of `SetIdentifier` must be unique for each resource record set that has the same combination of DNS name and type. Omit `SetIdentifier` for any other types of record sets.

**Weight** Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the `Weight` element for every weighted resource record set.
- You can only specify one `ResourceRecord` per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the `Name` and `Type` elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the `Name` and `Type` elements.
- For weighted (but not weighted alias) resource record sets, if you set `Weight` to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set `Weight` to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting `Weight` to 0 is different when you associate health checks with weighted resource record sets. For more information, see [Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover](#) in the Amazon Route 53 Developer Guide.

**Region** Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

**GeoLocation** Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a `Type` of `A` and a `ContinentCode` of `AF`.

```
ContinentCode
 The two-letter code for the continent.
 Valid values: AF | AN | AS | EU | OC | NA | SA
 Constraint: Specifying ContinentCode with either CountryCode or
↳SubdivisionCode
 returns an InvalidInput error.

CountryCode
 The two-letter code for the country.

SubdivisionCode
 The code for the subdivision, for example, a state in the United States
↳or a
 province in Canada.
```

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value `*` in the `CountryCode` element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the `Name` and `Type` elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't

mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of `CountryCode` is `*`, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a `*` resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.

- You can't create non-geolocation resource record sets that have the same values for the `Name` and `Type` elements as geolocation resource record sets.

**TTL** The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a `HealthCheckId` element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for `Weight`.

**ResourceRecords** A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see [Supported DNS Resource Record Types](#) in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

```
'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
```

This tells salt to lookup an EC2 instance with a tag 'some\_tag\_name' which has the value 'some\_string' and substitute the 'some\_instance\_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to `getattr(instance, 'attribute')` as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the `Name` tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automatically create Route 53 records for them.

**AliasTarget** The rules governing how to define an `AliasTarget` for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the [Boto 3 Route 53 page](#) and/or the [AWS Route 53 docs](#) and suss them for yourself - I sure won't claim to understand them particularly well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

### 21.19.23 salt.states.boto\_apigateway module

## Manage Apigateway Rest APIs

New in version 2016.11.0.

### depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
region: us-east-1
```

```
Ensure Apigateway API exists:
boto_apigateway.present:
- name: myfunction
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

`salt.states.boto_apigateway.absent`(*name*, *api\_name*, *stage\_name*, *nuke\_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the `stage_name` associated with the given `api_name` deployed by `boto_apigateway`'s `present` state is removed. If the currently associated deployment to the given `stage_name` has no other stages associated with it, the deployment will also be removed.

**name** Name of the swagger file in YAML format

**api\_name** Name of the rest api on AWS ApiGateway to ensure is absent.

**stage\_name** Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the `stage_name` has no other stages associated with it, the deployment will also be removed.

**nuke\_api** If True, removes the API itself only if there are no other stages associated with any other deployments once the given `stage_name` is removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

```
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name,
 api_key_required, lambda_integration_role,
 lambda_region=None, stage_variables=None, re-
 gion=None, key=None, keyid=None, profile=None,
 lambda_funcname_format='{stage}_{api}_{resource}_{method}',
 authorization_type='NONE', er-
 ror_response_template=None, response_template=None)
```

Ensure the specified `api_name` with the corresponding swaggerfile is deployed to the given `stage_name` in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
 "api_name": api_name,
 "swagger_file": basename_of_swagger_file
 "swagger_file_md5sum": md5sum_of_swagger_file,
 "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided `lambda_funcname_format` parameters:

- the default `lambda_funcname_format` is a string with the following substitutable keys: `"{stage}_{api}_{resource}_{method}"`. The user can choose to reorder the known keys.
- the stage key corresponds to the `stage_name` passed in.
- the api key corresponds to the `api_name` passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default `lambda_funcname_format`, given the following input:

```
api_name = ' Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: `'test_service_alpha_a_b_c_post'`

The canonicalization of these input parameters is done in the following order:

1. `lambda_funcname_format` is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with `'_'`
5. consecutive `'_'` are replaced with `'_'`

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in `errorMessage` field to aid the response mapping from Lambda to the proper error return status codes.

```
Error:
 type: object
 properties:
 stackTrace:
```

(continues on next page)

(continued from previous page)

```

type: array
items:
 type: array
 items:
 type: string
 description: call stack
errorType:
 type: string
 description: error type
errorMessage:
 type: string
 description: |
 Error message, will be matched based on pattern.
 If no pattern is specified, the default pattern used for response mapping
 ↪ will be +*.

```

**name** The name of the state definition

**api\_name** The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger\_file** Name of the location of the swagger rest api definition file in YAML format.

**stage\_name** Name of the stage we want to be associated with the given `api_name` and `swagger_file` definition

**api\_key\_required** True or False - whether the API Key is required to call API methods

**lambda\_integration\_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda\_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. `lambda_region` as passed in (is not None)
2. if `lambda_region` is None, use the region as if a `boto_lambda` function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by `boto_apigateway` functions, a final lookup will be attempted using the `boto_apigateway` region.

**stage\_variables** A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. `{'string': 'string'}`

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda\_funcname\_format** Please review the earlier example for the usage. The only substituable keys in the funcname format are `{stage}`, `{api}`, `{resource}`, `{method}`. Any other keys or positional substitution parameters will be flagged as an invalid input.

**authorization\_type** This field can be either 'NONE', or 'AWS\_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'

**error\_response\_template** String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: <http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html>

If set to None, the following default value is used:

```

'#{set($inputRoot = $input.path('$'))\n'
' {\n'
' "errorMessage" : "$inputRoot.errorMessage",\n'
' "errorType" : "$inputRoot.errorType",\n'
' "stackTrace" : [\n'

```

(continues on next page)

(continued from previous page)

```
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
' [\n'
'#foreach($elem in $stackTrace)\n'
' "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
']\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
']\n'
```

New in version 2017.7.0.

**response\_template** String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({}), template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

`salt.states.boto_apigateway.usage_plan_absent` (*name*, *plan\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to remove

```
usage plan absent:
boto_apigateway.usage_plan_absent:
- plan_name: my_usage_plan
- profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_association_absent` (*name*, *plan\_name*, *api\_stages*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is removed from provided `api_stages` If a plan is associated to stages not listed in `api_stages` parameter, those associations remain intact.

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:

**apiId** apiId of the api to detach usage plan from

**stage** stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
boto_apigateway.usage_plan_association_absent:
- plan_name: my_plan
- api_stages:
 - apiId: 9kb0404ec0
 stage: my_stage
 - apiId: l9v7o2aj90
 stage: my_stage
- profile: my_profile
```

```

salt.states.boto_apigateway.usage_plan_association_present(name, plan_name,
 api_stages, region=None, key=None,
 keyid=None, profile=None)

```

Ensures usage plan identified by name is added to provided api\_stages

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:

**apiId** apiId of the api to attach usage plan to

**stage** stage name of the api to attach usage plan to

```

UsagePlanAssociationPresent:
 boto_apigateway.usage_plan_association_present:
 - plan_name: my_plan
 - api_stages:
 - apiId: 9kb0404ec0
 stage: my_stage
 - apiId: l9v7o2aj90
 stage: my_stage
 - profile: my_profile

```

```

salt.states.boto_apigateway.usage_plan_present(name, plan_name, description=None,
 throttle=None, quota=None, re-
 gion=None, key=None, keyid=None,
 profile=None)

```

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

**name** name of the state

**plan\_name** [Required] name of the usage plan

**throttle** [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

**rateLimit** rate per second at which capacity bucket is populated

**burstLimit** maximum rate allowed

**quota** [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

**limit** [Required] number of calls permitted per quota period

**offset** [Optional] number of calls to be subtracted from the limit at the beginning of the period

**period** [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```

UsagePlanPresent:
 boto_apigateway.usage_plan_present:
 - plan_name: my_usage_plan
 - throttle:
 rateLimit: 70
 burstLimit: 100
 - quota:
 limit: 1000
 offset: 0
 period: DAY
 - profile: my_profile

```

## 21.19.24 salt.states.boto\_asg

### Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 region: us-east-1
```

```
Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
 - us-east-1a
 - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
 - myelb
- suspended_processes:
 - AddToLoadBalancer
 - AlarmNotification
- scaling_policies:
 - adjustment_type: ChangeInCapacity
 - as_name: api-production-iad
 - cooldown: 1800
 - min_adjustment_step: None
 - name: ScaleDown
 - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

*# Using a profile from pillars.*

```
Ensure myasg exists:
boto_asg.present:
```

(continues on next page)

(continued from previous page)

```

- name: myasg
- launch_config_name: mylc
- availability_zones:
 - us-east-1a
 - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
 - myelb
- profile: myprofile

Passing in a profile.
Ensure myasg exists:
boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:
 - myelb
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgsh
 region: us-east-1

Deleting an autoscale group with running instances.
Ensure myasg is deleted:
boto_asg.absent:
 - name: myasg
 # If instances exist, we must force the deletion of the asg.
 - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:
 - myelb
 - profile: myprofile
 - alarms:
 CPU:
 name: 'ASG CPU **MANAGED BY SALT**'

```

(continues on next page)

(continued from previous page)

```

attributes:
 metric: CPUUtilization
 namespace: AWS/EC2
 statistic: Average
 comparison: '>='
 threshold: 65.0
 period: 60
 evaluation_periods: 30
 unit: null
 description: 'ASG CPU'
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_asg\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
 CPU:
 name: 'ASG CPU **MANAGED BY SALT**'
 attributes:
 metric: CPUUtilization
 namespace: AWS/EC2
 statistic: Average
 comparison: '>='
 threshold: 65.0
 period: 60
 evaluation_periods: 30
 unit: null
 description: 'ASG CPU'
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
 boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:
 - myelb
 - profile: myprofile
 - alarms_from_pillar: my_asg_alarm
 # override CPU:attributes:threshold
 - alarms:
 CPU:
 attributes:

```

(continues on next page)

<b>threshold:</b> 50.0
------------------------

`salt.states.boto_asg.absent` (*name, force=False, region=None, key=None, keyid=None, profile=None, remove\_lc=False*)

Ensure the named autoscale group is deleted.

**name** Name of the autoscale group.

**force** Force deletion of autoscale group.

**remove\_lc** Delete the launch config as well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.present` (*name, launch\_config\_name, availability\_zones, min\_size, max\_size, launch\_config=None, desired\_capacity=None, load\_balancers=None, default\_cooldown=None, health\_check\_type=None, health\_check\_period=None, placement\_group=None, vpc\_zone\_identifier=None, subnet\_names=None, tags=None, termination\_policies=None, termination\_policies\_from\_pillar='boto\_asg\_termination\_policies', suspended\_processes=None, scaling\_policies=None, scaling\_policies\_from\_pillar='boto\_asg\_scaling\_policies', scheduled\_actions=None, scheduled\_actions\_from\_pillar='boto\_asg\_scheduled\_actions', alarms=None, alarms\_from\_pillar='boto\_asg\_alarms', region=None, key=None, keyid=None, profile=None, notification\_arn=None, notification\_arn\_from\_pillar='boto\_asg\_notification\_arn', notification\_types=None, notification\_types\_from\_pillar='boto\_asg\_notification\_types'*)

Ensure the autoscale group exists.

**name** Name of the autoscale group.

**launch\_config\_name** Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

**launch\_config** A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```
my_asg:
 boto_asg.present:
 - launch_config:
 - ebs_optimized: false
 - instance_profile_name: my_iam_profile
 - kernel_id: ''
 - ramdisk_id: ''
 - key_name: my_ssh_key
 - image_name: aws2015091-hvm
 - instance_type: c3.xlarge
 - instance_monitoring: false
 - security_groups:
 - my_sec_group_01
 - my_sec_group_02
```

**availability\_zones** List of availability zones for the group.

**min\_size** Minimum size of the group.

**max\_size** Maximum size of the group.

**desired\_capacity** The desired capacity of the group.

**load\_balancers** List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default\_cooldown** Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health\_check\_type** The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health\_check\_period** Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement\_group** Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc\_zone\_identifier** A list of the subnet identifiers of the Virtual Private Cloud.

**subnet\_names** For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags** A list of tags. Example:

```
- key: 'key'
 value: 'value'
 propagate_at_launch: true
```

**termination\_policies** A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination\_policies\_from\_pillar:** name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**suspended\_processes** List of processes to be suspended. see [http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US\\_SuspendResume.html](http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html)

**scaling\_policies** List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

**scaling\_policies\_from\_pillar:** name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

**scheduled\_actions:** a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
 scale_up_at_10:
 desired_capacity: 4
 min_size: 3
 max_size: 5
 recurrence: "0 9 * * 1-5"
 scale_down_at_7:
 desired_capacity: 1
 min_size: 1
 max_size: 1
 recurrence: "0 19 * * 1-5"
```

**scheduled\_actions\_from\_pillar:** name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

**alarms:** a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `":self:"` this will be replaced with the asg name. For example, `alarm_actions`

reading "[scaling\_policy:self:ScaleUp]" will map to the arn for this asg's scaling policy named "ScaleUp". In addition, any alarms that have only scaling\_policy as actions will be ignored if min\_size is equal to max\_size for this ASG.

**alarms\_from\_pillar:** name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**notification\_arn** The AWS arn that notifications will be sent to

**notification\_arn\_from\_pillar** name of the pillar dict that contains notification\_arn settings. A notification\_arn defined for this specific state will override the one from pillar.

**notification\_types** A list of event names that will trigger a notification. The list of valid notification types is:

- autoscaling:EC2\_INSTANCE\_LAUNCH
- autoscaling:EC2\_INSTANCE\_LAUNCH\_ERROR
- autoscaling:EC2\_INSTANCE\_TERMINATE
- autoscaling:EC2\_INSTANCE\_TERMINATE\_ERROR
- autoscaling:TEST\_NOTIFICATION

**notification\_types\_from\_pillar** name of the pillar dict that contains notification\_types settings. notification\_types defined for this specific state will override those from the pillar.

### 21.19.25 salt.states.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

**depends** boto

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
```

```
stack-present:
 boto_cfn.present:
 - name: mystack
 - template_body: salt://base/mytemplate.json
 - disable_rollback: true
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
stack-absent:
 boto_cfn.absent:
 - name: mystack
```

**salt.states.boto\_cfn.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cfn.present(name, template_body=None, template_url=None,
 parameters=None, notification_arns=None, disable_rollback=None,
 timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None,
 stack_policy_body=None, stack_policy_url=None, use_previous_template=None,
 stack_policy_during_update_body=None, stack_policy_during_update_url=None,
 region=None, key=None, keyid=None, profile=None)
```

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template\_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template\_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification\_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the [SNS\\_console](#) or your Command Line Interface (CLI).

disable\_rollback (bool) – Indicates whether or not to rollback on failure.

timeout\_in\_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE\_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY\_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on\_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO\_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack\_policy\_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack\_policy\_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use\_previous\_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack\_policy\_during\_update\_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

### 21.19.26 salt.states.boto\_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid`, and `region` via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
aws:
 region:
 us-east-1:
 profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

`depends` boto3

`salt.states.boto_cloudfront.present` (*name*, *config*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the CloudFront distribution is present.

**name** (string) Name of the CloudFront distribution

**config** (dict) Configuration for the distribution

**tags** (dict) Tags to associate with the distribution

**region** (string) Region to connect to

**key** (string) Secret key to use

**keyid** (string) Access key to use

**profile** (dict or string) A dict with `region`, `key`, and `keyid`, or a pillar key (string) that contains such a dict.

Example:

```

Manage my_distribution CloudFront distribution:
 boto_cloudfront.present:
 - name: my_distribution
 - config:
 Comment: 'partial config shown, most parameters elided'
 Enabled: True
 - tags:
 testing_key: testing_value

```

## 21.19.27 salt.states.boto\_cloudtrail module

### Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1

```

```

Ensure trail exists:
 boto_cloudtrail.present:
 - Name: mytrail
 - S3BucketName: mybucket
 - S3KeyPrefix: prefix
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

`salt.states.boto_cloudtrail.absent`(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the trail.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.present`(*name*, *Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=True*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=False*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *LoggingEnabled=True*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the trail.

**S3BucketName** Specifies the name of the Amazon S3 bucket designated for publishing log files.

**S3KeyPrefix** Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

**SnsTopicName** Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

**IncludeGlobalServiceEvents** Specifies whether the trail is publishing events from global services such as IAM to the log files.

**EnableLogFileValidation** Specifies whether log file integrity validation is enabled. The default is false.

**CloudWatchLogsLogGroupArn** Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

**CloudWatchLogsRoleArn** Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

**KmsKeyId** Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled** Whether logging should be enabled for the trail

**Tags** A dictionary of tags that should be set on the trail

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.28 salt.states.boto\_cloudwatch\_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
region: us-east-1
```

```
my test alarm:
boto_cloudwatch_alarm.present:
- name: my test alarm
- attributes:
 metric: ApproximateNumberOfMessagesVisible
 namespace: AWS/SQS
 statistic: Average
 comparison: ">="
 threshold: 20000.0
 period: 60
 evaluation_periods: 1
 description: test alarm via salt
 dimensions:
 QueueName:
 - the-sqs-queue-name
 alarm_actions:
 - arn:aws:sns:us-east-1:1111111:myalerting-action
```

`salt.states.boto_cloudwatch_alarm.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named cloudwatch alarm is deleted.

**name** Name of the alarm.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present` (*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

**name** Name of the alarm

**attributes** A dict of key/value cloudwatch alarm attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.29 salt.states.boto\_cloudwatch\_event module

## Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure event rule exists:
 boto_cloudwatch_event.present:
 - Name: mytrail
 - ScheduleExpression: 'rate(120 minutes)'
 - State: 'DISABLED'
 - Targets:
 - Id: "target1"
 Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
 Input: '{"arbitrary": "json"}'
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_cloudwatch_event.absent`(*name*, *Name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.present`(*name*, *Name=None*, *ScheduleExpression=None*, *EventPattern=None*, *Description=None*, *RoleArn=None*, *State=None*, *Targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.

**ScheduleExpression** The scheduling expression. For example, `cron(0 20 * * ? *)`, "rate(5 minutes)"

**EventPattern** The event pattern.

**Description** A description of the rule

**State** Indicates whether the rule is ENABLED or DISABLED.

**RoleArn** The Amazon Resource Name (ARN) of the IAM role associated with the rule.

**Targets** A list of rresources to be invoked when the rule is triggered.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.30 salt.states.boto\_cognitoidentity module

#### Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via `package`, or `pip`.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
 region: us-east-1
```

```
Ensure function exists:
 boto_cognitoidentity.pool_present:
 - PoolName: my_identity_pool
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.pool_absent` (*name*, *IdentityPoolName*, *RemoveAllMatched=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.

**name** The name of the state definition.

**IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

**RemoveAllMatched** If True, all identity pools with the matching `IdentityPoolName` will be removed. If False and there are more than one identity pool with the matching `IdentityPoolName`, no action will be taken.

If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, AuthenticatedRole, AllowUnauthenticatedIdentities=False, UnauthenticatedRole=None, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)
```

Ensure Cognito Identity Pool exists.

**name** The name of the state definition

**IdentityPoolName** Name of the Cognito Identity Pool

**AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

**AllowUnauthenticatedIdentities** Whether to allow anonymous user identities

**UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities

**SupportedLoginProviders** A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

**DeveloperProviderName** A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs** A list or pillar name that contains a list of OpenID Connect provider ARNs.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.31 salt.states.boto\_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjakghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
 region: us-east-1

```

```

Ensure daily data pipeline exists:
 boto_datapipeline.present:
 - name: my-datapipeline
 - pipeline_objects:
 DefaultSchedule:
 name: Every 1 day
 fields:
 period: 1 Day
 type: Schedule
 startAt: FIRST_ACTIVATION_DATE_TIME
 - parameter_values:
 myDDBTableName: my-dynamo-table

```

`salt.states.boto_datapipeline.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the `service_name` does not exist

**name** Name of the service to ensure a data pipeline does not exist for.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_datapipeline.present`(*name*, *pipeline\_objects=None*, *pipeline\_objects\_from\_pillars='boto\_datapipeline\_pipeline\_objects'*, *parameter\_objects=None*, *parameter\_objects\_from\_pillars='boto\_datapipeline\_parameter\_objects'*, *parameter\_values=None*, *parameter\_values\_from\_pillars='boto\_datapipeline\_parameter\_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

**name** Name of the service to ensure a data pipeline exists for.

**pipeline\_objects** Pipeline objects to use. Will override objects read from pillars.

**pipeline\_objects\_from\_pillars** The pillar key to use for lookup.

**parameter\_objects** Parameter objects to use. Will override objects read from pillars.

**parameter\_objects\_from\_pillars** The pillar key to use for lookup.

**parameter\_values** Parameter values to use. Will override values read from pillars.

**parameter\_values\_from\_pillars** The pillar key to use for lookup.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.32 salt.states.boto\_dynamodb

### Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 region: us-east-1
```

```
Ensure DynamoDB table does not exist:
 boto_dynamodb.absent:
 - table_name: new_table
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 - region: us-east-1

Ensure DynamoDB table exists:
 boto_dynamodb.present:
 - table_name: new_table
 - read_capacity_units: 1
 - write_capacity_units: 2
 - hash_key: primary_id
 - hash_key_data_type: N
 - range_key: start_timestamp
 - range_key_data_type: N
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 - region: us-east-1
 - local_indexes:
 - index:
 - name: "primary_id_end_timestamp_index"
 - hash_key: primary_id
 - hash_key_data_type: N
 - range_key: end_timestamp
 - range_key_data_type: N
 - global_indexes:
 - index:
 - name: "name_end_timestamp_index"
 - hash_key: name
 - hash_key_data_type: S
 - range_key: end_timestamp
 - range_key_data_type: N
 - read_capacity_units: 3
 - write_capacity_units: 4
```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name

will be defined by the name attribute provided, plus the DynamoDB resource name.

```

Ensure DynamoDB table exists:
 boto_dynamodb.present:
 - name: new_table
 - read_capacity_units: 1
 - write_capacity_units: 2
 - hash_key: primary_id
 - hash_key_data_type: N
 - range_key: start_timestamp
 - range_key_data_type: N
 - alarms:
 ConsumedWriteCapacityUnits:
 name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
 attributes:
 metric: ConsumedWriteCapacityUnits
 namespace: AWS/DynamoDB
 statistic: Sum
 comparison: '>='
 # threshold_percent is used to calculate the actual threshold
 # based on the provisioned capacity for the table.
 threshold_percent: 0.75
 period: 300
 evaluation_periods: 2
 unit: Count
 description: 'DynamoDB ConsumedWriteCapacityUnits'
 alarm_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
 - region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_dynamodb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

boto_dynamodb_alarms:
 ConsumedWriteCapacityUnits:
 name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
 attributes:
 metric: ConsumedWriteCapacityUnits
 namespace: AWS/DynamoDB
 statistic: Sum
 comparison: '>='
 # threshold_percent is used to calculate the actual threshold
 # based on the provisioned capacity for the table.
 threshold_percent: 0.75
 period: 300
 evaluation_periods: 2
 unit: Count
 description: 'DynamoDB ConsumedWriteCapacityUnits'
 alarm_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']

```

(continues on next page)

```

Ensure DynamoDB table exists:
boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
 ConsumedWriteCapacityUnits:
 attributes:
 threshold_percent: 0.90
 period: 900

```

**exception** salt.states.boto\_dynamodb.GsiNotUpdatableError

Raised when a global secondary index cannot be updated.

salt.states.boto\_dynamodb.**absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the DynamoDB table does not exist.

**name** Name of the DynamoDB table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto\_dynamodb.**present** (*name=None, table\_name=None, region=None, key=None, keyid=None, profile=None, read\_capacity\_units=None, write\_capacity\_units=None, alarms=None, alarms\_from\_pillar='boto\_dynamodb\_alarms', hash\_key=None, hash\_key\_data\_type=None, range\_key=None, range\_key\_data\_type=None, local\_indexes=None, global\_indexes=None, backup\_configs\_from\_pillars='boto\_dynamodb\_backup\_configs'*)

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

**name** Name of the DynamoDB table

**table\_name** Name of the DynamoDB table (deprecated)

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**read\_capacity\_units** The read throughput for this table

**write\_capacity\_units** The write throughput for this table

**hash\_key** The name of the attribute that will be used as the hash key for this table

**hash\_key\_data\_type** The DynamoDB datatype of the hash key

**range\_key** The name of the attribute that will be used as the range key for this table

**range\_key\_data\_type** The DynamoDB datatype of the range key

**local\_indexes** The local indexes you would like to create  
**global\_indexes** The global indexes you would like to create  
**backup\_configs\_from\_pillars** Pillars to use to configure DataPipeline backups

### 21.19.33 salt.states.boto\_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - save_private: /root/
 - region: eu-west-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHWupUjasdfldkfdklgjsdfjajkgHs
```

```
import-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - upload_public: 'ssh-rsa AAAA'
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHWupUjasdfldkfdklgjsdfjajkgHs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - upload_public: salt://mybase/public_key.pub
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHWupUjasdfldkfdklgjsdfjajkgHs
```

The below code deletes a key pair:

```
delete-key-pair:
 boto_ec2.key_absent:
 - name: mykeypair
 - region: eu-west-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHWupUjasdfldkfdklgjsdfjajkgHs
```

**salt.states.boto\_ec2.eni\_absent** (*name, release\_eip=False, region=None, key=None, keyid=None, profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**release\_eip** True/False - release any EIP associated with the ENI

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.eni_present(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, source_dest_check=True, allocate_eip=None, arecords=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the EC2 ENI exists.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**subnet\_id** The VPC subnet ID the ENI will exist within.

**subnet\_name** The VPC subnet name the ENI will exist within.

**private\_ip\_address** The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

**description** Description of the key.

**groups** A list of security groups to apply to the ENI.

**source\_dest\_check** Boolean specifying whether source/destination checking is enabled on the ENI.

**allocate\_eip** allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

**arecords** A list of arecord dicts with attributes needed for the DNS add\_record state. By default the boto\_route53.add\_record state will be used, which requires: name, zone, ttl, and identifier. See the boto\_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.instance_absent(name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None)
```

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

**name** (string) - The name of the state definition.

**instance\_name** (string) - The name of the instance.

**instance\_id** (string) - The ID of the instance.

**release\_eip** (bool) - Release any associated EIPs during termination.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**filters** (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```
- filters:
 vpc-id: vpc-abcdef12
```

```

salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None,
 image_id=None, image_name=None,
 tags=None, key_name=None, security_groups=None,
 user_data=None, instance_type=None, placement=None,
 kernel_id=None, ramdisk_id=None, vpc_id=None,
 vpc_name=None, monitoring_enabled=None,
 subnet_id=None, subnet_name=None, private_ip_address=None,
 block_device_map=None, disable_api_termination=None,
 instance_initiated_shutdown_behavior=None,
 placement_group=None, client_token=None,
 security_group_ids=None, security_group_names=None,
 additional_info=None, tenancy=None, instance_profile_arn=None,
 instance_profile_name=None, ebs_optimized=None,
 network_interfaces=None, network_interface_name=None,
 network_interface_id=None, attributes=None,
 target_state=None, public_ip=None, allocation_id=None,
 allocate_eip=False, region=None, key=None,
 keyid=None, profile=None)

```

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the `instance_name` attribute (generally the FQDN of the instance).

**instance\_name** (string) - The name of the instance, generally its FQDN. Exclusive with `'instance_id'`.

**instance\_id** (string) - The ID of the instance (if known). Exclusive with `'instance_name'`.

**image\_id** (string) - The ID of the AMI image to run.

**image\_name** (string) - The name of the AMI image to run.

**tags** (dict) - Tags to apply to the instance.

**key\_name** (string) - The name of the key pair with which to launch instances.

**security\_groups** (list of strings) - The names of the EC2 classic security groups with which to associate instances

**user\_data** (string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance\_type** (string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

**placement** (string) - The Availability Zone to launch the instance into.

**kernel\_id** (string) - The ID of the kernel with which to launch the instances.

**ramdisk\_id** (string) - The ID of the RAM disk with which to launch the instances.

**vpc\_id** (string) - The ID of a VPC to attach the instance to.

**vpc\_name** (string) - The name of a VPC to attach the instance to.

**monitoring\_enabled** (bool) - Enable detailed CloudWatch monitoring on the instance.

**subnet\_id** (string) - The ID of the subnet within which to launch the instances for VPC.

**subnet\_name** (string) - The name of the subnet within which to launch the instances for VPC.

**private\_ip\_address** (string) - If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

**block\_device\_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) - A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

**disable\_api\_termination** (bool) - If True, the instances will be locked and will not be able to be terminated via the API.

**instance\_initiated\_shutdown\_behavior** (string) - Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- 'stop'

- 'terminate'

**placement\_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client\_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security\_group\_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.

**security\_group\_names** (list of strings) – The names of the VPC security groups with which to associate instances.

**additional\_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are: "default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance\_profile\_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance\_profile\_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs\_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.

**network\_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network\_interface\_name**

(string) - The name of Elastic Network Interface to attach

New in version 2016.11.0.

**network\_interface\_id**

(string) - The id of Elastic Network Interface to attach

New in version 2016.11.0.

**attributes** (dict) - Instance attributes and value to be applied to the instance. Available options are:

- instanceType - A valid instance type (m1.small)
- kernel - Kernel ID (None)
- ramdisk - Ramdisk ID (None)
- userData - Base64 encoded String (None)
- disableApiTermination - Boolean (true)
- instanceInitiatedShutdownBehavior - stop|terminate
- blockDeviceMapping - List of strings - ie: ['/dev/sda=false']
- sourceDestCheck - Boolean (true)
- groupSet - Set of Security Groups or IDs
- ebsOptimized - Boolean (false)
- sriovNetSupport - String - ie: 'simple'

**target\_state** (string) - The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

**public\_ip:** (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation\_id instead.

**allocation\_id:** (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public\_ip instead.

**allocate\_eip:** (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the 'release\_eip' flag to 'instance\_absent'.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
 Deletes a key pair

`salt.states.boto_ec2.key_present` (*name*, *save\_private=None*, *upload\_public=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)  
 Ensure key pair is present.

`salt.states.boto_ec2.private_ips_absent` (*name*, *network\_interface\_name=None*,  
*network\_interface\_id=None*, *private\_ip\_addresses=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure an ENI does not have secondary private ip addresses associated with it

**name** (String) - State definition name

**network\_interface\_id** (String) - The EC2 network interface id, example eni-123456789

**private\_ip\_addresses** (List or String) - The secondary private ip address(es) that should be absent on the ENI.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.private_ips_present` (*name*, *network\_interface\_name=None*,  
*network\_interface\_id=None*, *private\_ip\_addresses=None*, *allow\_reassignment=False*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure an ENI has secondary private ip addresses associated with it

**name** (String) - State definition name

**network\_interface\_id** (String) - The EC2 network interface id, example eni-123456789

**private\_ip\_addresses** (List or String) - The secondary private ip address(es) that should be present on the ENI.

**allow\_reassignment** (Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.snapshot_created` (*name*, *ami\_name*, *instance\_name*,  
*wait\_until\_available=True*,  
*wait\_timeout\_seconds=300*, *\*\*kwargs*)

Create a snapshot from the given instance

New in version 2016.3.0.

`salt.states.boto_ec2.volume_absent` (*name*, *volume\_name=None*, *volume\_id=None*, *in-*  
*stance\_name=None*, *instance\_id=None*, *device=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

**name** State definition name.

**volume\_name** Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

**volume\_id** Resource ID of the volume.

**instance\_name** Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance\_id'. Requires 'device'.

**instance\_id** Only remove volume if it is attached to this instance. Exclusive with 'instance\_name'. Requires 'device'.

**device** Match by device rather than ID. Requires one of 'instance\_name' or 'instance\_id'.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the EC2 volume is present and attached.

**name** State definition name.

**volume\_name** The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.

**volume\_id** Resource ID of the volume. Exclusive with 'volume\_name'.

**instance\_name** Attach volume to instance with this Name tag. Exclusive with 'instance\_id'.

**instance\_id** Attach volume to instance with this ID. Exclusive with 'instance\_name'.

**device** The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**size** The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**snapshot\_id** The snapshot ID from which the new Volume will be created. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**volume\_type** The type of the volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. Valid volume types for AWS can be found here: <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html>

**iops** The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**encrypted** Specifies whether the volume should be encrypted. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**kms\_key\_id** If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.volumes_tagged(name, tag_maps, authoritative=False, region=None, key=None, keyid=None, profile=None)
```

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

**name** State definition name.

**tag\_maps** List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of boto\_ec2.get\_all\_volumes(), and 'tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of volume\_ids or an instance\_name (with instance\_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

```

- filters:
 attachment.instance_id: i-abcdef12
 tags:
 Name: dev-int-abcdef12.aws-foo.com
- filters:
 attachment.device: /dev/sdf
 tags:
 ManagedSnapshots: true
 BillingGroup: bubba.hotep@aws-foo.com
- filters:
 instance_name: prd-foo-01.aws-foo.com
 tags:
 Name: prd-foo-01.aws-foo.com
 BillingGroup: infra-team@aws-foo.com
- filters:
 volume_ids: [vol-12345689, vol-abcdef12]
 tags:
 BillingGroup: infra-team@aws-foo.com

```

**authoritative** Should un-declared tags currently set on matched volumes be deleted? Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.34 salt.states.boto\_elasticache

#### Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkgsh

```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkgsh
 region: us-east-1

```

```

Ensure myelasticache exists:
boto_elasticache.present:
- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs

Using a profile from pillars
Ensure myelasticache exists:
boto_elasticache.present:
- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile: myprofile

Passing in a profile
Ensure myelasticache exists:
boto_elasticache.present:
- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs

```

`salt.states.boto_elasticache.absent`(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

**name** Name of the cache cluster.

**wait** Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.cache_cluster_absent`(*\*args*, *\*\*kwargs*)

`salt.states.boto_elasticache.cache_cluster_present`(*\*args*, *\*\*kwargs*)

`salt.states.boto_elasticache.creategroup`(*name*, *primary\_cluster\_id*, *replication\_group\_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

**name** Name of replication group

**wait** Waits for the group to be available

**primary\_cluster\_id** Name of the master cache node

**replication\_group\_description** Description for the group

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None,
 num_cache_nodes=None, pre-
 ferred_availability_zone=None, port=None,
 cache_parameter_group_name=None,
 cache_security_group_names=None,
 replication_group_id=None,
 auto_minor_version_upgrade=True, secu-
 rity_group_ids=None, cache_subnet_group_name=None,
 engine_version=None, notification_topic_arn=None,
 preferred_maintenance_window=None, wait=None,
 region=None, key=None, keyid=None, profile=None)

```

Ensure the cache cluster exists.

**name** Name of the cache cluster (cache cluster id).  
**engine** The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.  
**cache\_node\_type** The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: [https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create\\_cache\\_cluster](https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster)  
**num\_cache\_nodes** The number of cache nodes that the cache cluster will have.  
**preferred\_availability\_zone** The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.  
**port** The port number on which each of the cache nodes will accept connections.  
**cache\_parameter\_group\_name** The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.  
**cache\_security\_group\_names** A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.  
**replication\_group\_id** The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.  
**auto\_minor\_version\_upgrade** Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.  
**security\_group\_ids** One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.  
**cache\_subnet\_group\_name** The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.  
**engine\_version** The version number of the cache engine to be used for this cluster.  
**notification\_topic\_arn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.  
**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00  
**wait** Boolean. Wait for confirmation from boto that the cluster is in the available state.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.replication_group_absent(name, tags=None, re-
 gion=None, key=None,
 keyid=None, profile=None)
```

```
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None,
 key=None, keyid=None, pro-
 file=None)
```

```
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, sub-
 net_names=None, description=None,
 tags=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name** The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of VPC subnet IDs for the cache subnet group. Exclusive with `subnet_names`.

**subnet\_names** A list of VPC subnet names for the cache subnet group. Exclusive with `subnet_ids`.

**description** Subnet group description.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.35 salt.states.boto\_elasticsearch\_domain module

### Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
region: us-east-1
```

```

Ensure domain exists:
 boto_elasticsearch_domain.present:
 - DomainName: mydomain
 - profile='user-credentials'
 - ElasticsearchVersion: "2.3"
 - ElasticsearchClusterConfig:
 InstanceType": "t2.micro.elasticsearch"
 InstanceCount: 1
 DedicatedMasterEnabled: False
 ZoneAwarenessEnabled: False
 - EBSOptions:
 EBSEnabled: True
 VolumeType: "gp2"
 VolumeSize: 10
 Iops: 0
 - AccessPolicies:
 Version: "2012-10-17"
 Statement:
 - Effect: "Allow"
 - Principal:
 AWS: "*"
 - Action:
 - "es:*"
 - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
 - Condition:
 IPAddress:
 "aws:SourceIp":
 - "127.0.0.1"
 - "127.0.0.2"
 - SnapshotOptions:
 AutomatedSnapshotStartHour: 0
 - AdvancedOptions:
 rest.action.multi.allow_explicit_index": "true"
 - Tags:
 a: "b"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakgghs

```

`salt.states.boto_elasticsearch_domain.absent`(*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

**name** The name of the state definition.

**DomainName** Name of the domain.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion='1.5'*)

Ensure domain exists.

**name** The name of the state definition

**DomainName** Name of the domain.

**ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) – The instance type for an Elasticsearch cluster.

InstanceCount (integer) – The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) – A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) – A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) – The instance type for a dedicated master node.

DedicatedMasterCount (integer) – Total number of dedicated master nodes, active and on standby, for the cluster.

**EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) – Specifies whether EBS-based storage is enabled.

VolumeType (string) – Specifies the volume type for EBS-based storage.

VolumeSize (integer) – Integer to specify the size of an EBS volume.

Iops (integer) – Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) – Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion** String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

### 21.19.36 salt.states.boto\_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit `elb` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfjlgjsdfjakghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - availability_zones:
 - us-east-1a
 - us-east-1c
 - us-east-1d
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 - listeners:
 - elb_port: 443
 instance_port: 80
 elb_protocol: HTTPS
 instance_protocol: HTTP
 certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
 policies:
 - my-ssl-policy
 - cookie-policy
 - elb_port: 8210
 instance_port: 8210
 elb_protocol: TCP
 - backends:
 - instance_port: 80
 policies:
 - enable-proxy-protocol
 - health_check:
 target: 'HTTP:80/'
 - attributes:
 cross_zone_load_balancing:
 enabled: true
 access_log:
 enabled: true
 s3_bucket_name: 'mybucket'
 s3_bucket_prefix: 'my-logs'
 emit_interval: 5
 connecting_settings:
 idle_timeout: 60
 - cnames:
 - name: mycname.example.com.
 zone: example.com.
 ttl: 60
 - name: myothercname.example.com.
 zone: example.com.
 - security_groups:
 - my-security-group
 - policies:
 - policy_name: my-ssl-policy
 policy_type: SSLNegotiationPolicyType
 policy:
```

(continues on next page)

(continued from previous page)

```

 Protocol-TLSv1.2: true
 Protocol-SSLv3: false
 Server-Defined-Cipher-Order: true
 ECDHE-ECDSA-AES128-GCM-SHA256: true
 - policy_name: cookie-policy
 policy_type: LBCookieStickinessPolicyType
 policy: {} # no policy means this is a session cookie
 - policy_name: enable-proxy-protocol
 policy_type: ProxyProtocolPolicyType
 policy:
 ProxyProtocol: true

Using a profile from pillars
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile

Passing in a profile
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key 'boto\_elb\_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```

my_elb_attributes:
 cross_zone_load_balancing:
 enabled: true
 connection_draining:
 enabled: true
 timeout: 20
 access_log:
 enabled: true
 s3_bucket_name: 'mybucket'
 s3_bucket_prefix: 'my-logs'
 emit_interval: 5

```

Overriding the attribute values on the resource:

```

Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - attributes_from_pillar: my_elb_attributes
 # override cross_zone_load_balancing:enabled
 - attributes:
 cross_zone_load_balancing:
 enabled: false

```

(continues on next page)

(continued from previous page)

```
- profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile
 - alarms:
 UnHealthyHostCount:
 name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
 attributes:
 metric: UnHealthyHostCount
 namespace: AWS/ELB
 statistic: Average
 comparison: '>='
 threshold: 1.0
 period: 600
 evaluation_periods: 6
 unit: null
 description: ELB UnHealthyHostCount
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_elb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
 UnHealthyHostCount:
 name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
 attributes:
 metric: UnHealthyHostCount
 namespace: AWS/ELB
 statistic: Average
 comparison: '>='
 threshold: 1.0
 period: 600
 evaluation_periods: 6
 unit: null
 description: ELB UnHealthyHostCount
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile
```

(continues on next page)

(continued from previous page)

```

- alarms_from_pillar: my_elb_alarm
override UnHealthyHostCount:attributes:threshold
- alarms:
 UnHealthyHostCount:
 attributes:
 threshold: 2.0

```

Tags can also be set:

New in version 2016.3.0.

```

Ensure myelb ELB exists:
boto_elb.present:
- name: myelb
- region: us-east-1
- profile: myelbprofile
- tags:
 MyTag: 'My Tag Value'
 OtherTag: 'My Other Value'

```

`salt.states.boto_elb.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

**name** name of the ELB

`salt.states.boto_elb.present` (*name, listeners, availability\_zones=None, subnets=None, subnet\_names=None, security\_groups=None, scheme='internet-facing', health\_check=None, attributes=None, attributes\_from\_pillar='boto\_elb\_attributes', cnames=None, alarms=None, alarms\_from\_pillar='boto\_elb\_alarms', policies=None, policies\_from\_pillar='boto\_elb\_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, tags=None, instance\_ids=None, instance\_names=None*)

Ensure the ELB exists.

**name** Name of the ELB.

**availability\_zones** A list of availability zones for this ELB.

**listeners** A list of listener lists; example:

```

[
 ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
 ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
↪mycert']
]

```

**subnets** A list of subnet IDs in your VPC to attach to your LoadBalancer.

**subnet\_names** A list of subnet names in your VPC to attach to your LoadBalancer.

**security\_groups** The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```

- security_groups:
- secgroup-one
- secgroup-two

```

Or as a comma-separated string:

```
- security_groups: secgroup-one, secgroup-two
```

**scheme** The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

**health\_check** A dict defining the health check for this ELB.

**attributes** A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the `salt.modules.boto_elb.set_attributes` function for recognized attributes.

**attributes\_from\_pillar** name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

**cnames** A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: `name`, `zone`, `ttl`, and `identifier`. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the `cnames` dict will be passed to the state as `kwargs`.

See the `salt.states.boto_route53` state for information about these attributes.

**alarms**: a dictionary of `name->boto_cloudwatch_alarm` sections to be associated with this ELB. All attributes should be specified except for `dimension` which will be automatically set to this ELB.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

**alarms\_from\_pillar**: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

**wait\_for\_sync** Wait for an `INSYNC` change status from `Route53`.

**tags** dict of tags

**instance\_ids** list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_names`.

**instance\_names** list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_ids`.

```
salt.states.boto_elb.register_instances(name, instances, region=None, key=None,
 keyid=None, profile=None)
```

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

**name** The name of the Elastic Load Balancer to add EC2 instances to.

**instances** A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
```

```
 boto_elb.register_instances:
```

```
 - name: myloadbalancer
```

```
 - instances:
```

```
 - instance-id1
```

```
 - instance-id2
```

### 21.19.37 salt.states.boto\_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkgHwupUjasdfldkflkgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkgHwupUjasdfldkflkgjsdfjajkghs
 region: us-east-1
```

```
salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, re-
 gion=None, key=None, keyid=None, pro-
 file=None, health_check_protocol='HTTP',
 health_check_port='traffic-
 port', health_check_path='/',
 health_check_interval_seconds=30,
 health_check_timeout_seconds=5,
 healthy_threshold_count=5, un-
 healthy_threshold_count=2, **kwargs)
```

New in version 2017.11.0.

Create target group if not present.

**name** (string) - The name of the target group.

**protocol** (string) - The protocol to use for routing traffic to the targets

**port** (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

**vpc\_id** (string) - The identifier of the virtual private cloud (VPC).

**health\_check\_protocol** (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health\_check\_port** (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health\_check\_path** (string) - The ping path that is the destination on the targets for health checks. The default is /.

**health\_check\_interval\_seconds** (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health\_check\_timeout\_seconds** (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy\_threshold\_count** (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy\_threshold\_count** (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns** (bool) - True on success, False on failure.

CLI example: .. code-block:: yml

```
create-target:
```

**boto\_elb2.create\_targets\_group:**

- name: myALB
- protocol: https
- port: 443
- vpc\_id: myVPC

**salt.states.boto\_elbv2.delete\_target\_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

**name** (string) - The Amazon Resource Name (ARN) of the resource.

**returns** (bool) - True on success, False on failure.

CLI example:

```
check-target:
 boto_elb2.delete_targets_group:
 - name: myALB
 - protocol: https
 - port: 443
 - vpc_id: myVPC
```

**salt.states.boto\_elbv2.targets\_deregistered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, **\*\*kwargs**)

Remove targets to an Application Load Balancer target group.

**name** The ARN of the Application Load Balancer Target Group to remove targets from.

**targets** A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
 boto_elb.targets_deregistered:
 - name: arn:myloadbalancer
 - targets:
 - instance-id1
 - instance-id2
```

**salt.states.boto\_elbv2.targets\_registered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, **\*\*kwargs**)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

**name** The ARN of the Application Load Balancer Target Group to add targets to.

**targets** A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
 boto_elb.targets_registered:
 - name: arn:myloadbalancer
 - targets:
 - instance-id1
 - instance-id2
```

## 21.19.38 salt.states.boto\_iam

### Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
 boto_iam.user_absent:
 - name: myuser
 - delete_keys: true
```

```
delete-keys:
 boto_iam.keys_absent:
 - access_keys:
 - 'AKIAJHTMIQ2ASDFLASDF'
 - 'PQIAJHTMIQ2ASRTLASFR'
 - user_name: myuser
```

```
create-user:
 boto_iam.user_present:
 - name: myuser
 - policies:
 mypolicy: |
 {
 "Version": "2012-10-17",
 "Statement": [{
 "Effect": "Allow",
 "Action": "*",
 "Resource": "*"}]
 }
 - password: NewPassword$$1
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
 boto_iam.group_present:
 - name: mygroup
 - users:
 - myuser
 - myuser1
 - policies:
 mypolicy: |
 {
 "Version": "2012-10-17",
 "Statement": [{
 "Effect": "Allow",
 "Action": "*",
 "Resource": "*"}]
 }
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
change-policy:
 boto_iam.account_policy:
```

(continues on next page)

(continued from previous page)

```
- change_password: True
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
create server certificate:
boto_iam.server_cert_present:
- name: mycert
- public_key: salt://base/mycert.crt
- private_key: salt://base/mycert.key
- cert_chain: salt://base/mycert_chain.crt
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
delete server certificate:
boto_iam.server_cert_absent:
- name: mycert
```

```
create keys for user:
boto_iam.keys_present:
- name: myusername
- number: 2
- save_dir: /root
- region: eu-west-1

↪ "Allow", "Resource": ["arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
add-saml-provider:
boto_iam.saml_provider_present:
- name: my_saml_provider
- saml_metadata_document: salt://base/files/provider.xml
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

```
salt.states.boto_iam.account_policy(name=None, allow_users_to_change_password=None,
 hard_expiry=None, max_password_age=None,
 minimum_password_length=None, password_reuse_prevention=None,
 require_lowercase_characters=None, require_numbers=None,
 require_uppercase_characters=None, require_symbols=None,
 region=None, key=None, keyid=None, profile=None)
```

Change account policy.

New in version 2015.8.0.

**name (string)** The name of the account policy

**allow\_users\_to\_change\_password (bool)** Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

**hard\_expiry (bool)** Prevents IAM users from setting a new password after their password has expired.

**max\_password\_age (int)** The number of days that an IAM user password is valid.

**minimum\_password\_length (int)** The minimum number of characters allowed in an IAM user password.

**password\_reuse\_prevention (int)** Specifies the number of previous passwords that IAM users are prevented from reusing.

**require\_lowercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

**require\_numbers (bool)** Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require\_symbols (bool)** Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: `! @ # $ % ^ & * ( ) _ + - = [ ] { } | ' ``

**require\_uppercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string)

`salt.states.boto_iam.group_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM group is absent.

**name (string)** The name of the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.group_present` (*name*, *policies=None*, *policies\_from\_pillars=None*, *managed\_policies=None*, *users=None*, *path='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete\_policies=True*)

New in version 2015.8.0.

Ensure the IAM group is present

**name (string)** The name of the new group.

**path (string)** The path for the group, defaults to `'/'`

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument.

If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies (list)** A list of policy names or ARNs that should be attached to this group.

**users (list)** A list of users to be added to the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies (boolean)** Delete or detach existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

`salt.states.boto_iam.keys_absent` (*access\_keys, user\_name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user access\_key\_id is absent.

**access\_key\_id (list)** A list of access key ids  
**user\_name (string)** The username of the user  
**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_present` (*name, number, save\_dir, region=None, key=None, keyid=None, profile=None, save\_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.

**name (string)** The name of the new user.  
**number (int)** Number of keys that user should have.  
**save\_dir (string)** The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.  
**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
**save\_format (dict)** Save format is repeated for each key. Default format is "{2}\n{0}\n{3}\n{1}\n", where {0} and {1} are placeholders for new key\_id and key respectively, whereas {2} and {3} are "key\_id-{number}" and 'key-{number}' strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

**name (string)** The name of the new policy.  
**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_present` (*name, policy\_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

**name (string)** The name of the new policy.  
**policy\_document (dict)** The document of the new policy  
**path (string)** The path in which the policy will be created. Default is '/'.  
**description (string)** Description  
**region (string)** Region to connect to.  
**key (string)** Secret key to be used.  
**keyid (string)** Access key to be used.  
**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_present` (*name*, *saml\_metadata\_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.server_cert_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.server_cert_present` (*name*, *public\_key*, *private\_key*, *cert\_chain=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**public\_key (string)** The contents of the public key certificate in PEM-encoded format.

**private\_key (string)** The contents of the private key in PEM-encoded format.

**cert\_chain (string)** The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

**path (string)** The path for the server certificate.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

`salt.states.boto_iam.user_absent` (*name*, *delete\_keys=True*, *delete\_mfa\_devices=True*, *delete\_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

**name (string)** The name of the new user.

**delete\_keys (bool)** Delete all keys from user.

**delete\_mfa\_devices (bool)** Delete all mfa devices from user.

New in version 2016.3.0.

**delete\_profile (bool)** Delete profile from user.

New in version 2016.3.0.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam.user\_present**(*name, policies=None, policies\_from\_pillars=None, managed\_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user is present

**name (string)** The name of the new user.

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)** A list of managed policy names or ARNs that should be attached to this user.

**password (string)** The password for the new user. Must comply with account policy.

**path (string)** The path of the user. Default is '/'.

New in version 2015.8.2.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.39 salt.states.boto\_iam\_role

#### Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgsh
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askjghsdfjkghWupUjasdfldfklgjsdfjajkghs
 region: us-east-1

```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```

myrole:
 boto_iam_role.present:
 - region: us-east-1
 - key: GKTADJGHEIQSXMKKRBJ08H
 - keyid: askdjghsdfjkghWupUjasdfldfklgjsdfjajkghs
 - policies_from_pillars:
 - shared_iam_bootstrap_policy
 - policies:
 MySQLPolicy:
 Statement:
 - Action:
 - sqs:*
 Effect: Allow
 Resource:
 - arn:aws:sqs:*:*:*
 Sid: MyPolicySQS1
 MyS3Policy:
 Statement:
 - Action:
 - s3:GetObject
 Effect: Allow
 Resource:
 - arn:aws:s3:*:*:mybucket/*

```

*# Using a credentials profile from pillars*

```

myrole:
 boto_iam_role.present:
 - profile: myiamprofile

```

*# Passing in a credentials profile*

```

myrole:
 boto_iam_role.present:
 - profile:
 key: GKTADJGHEIQSXMKKRBJ08H
 keyid: askdjghsdfjkghWupUjasdfldfklgjsdfjajkghs
 region: us-east-1

```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.absent` (*name, region=None, key=None, keyid=None, profile=None*)  
 Ensure the IAM role is deleted.  
**name** Name of the IAM role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_iam_role.present(name, policy_document=None, policy_document_from_pillars=None, path=None, policies=None, policies_from_pillars=None, managed_policies=None, create_instance_profile=True, region=None, key=None, keyid=None, profile=None, delete_policies=True)

```

Ensure the IAM role exists.

**name** Name of the IAM role.

**policy\_document** The policy that grants an entity permission to assume the role. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policy\_document\_from\_pillars** A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the `policy_document` argument.

New in version 2017.7.0.

**path** The path to the role/instance profile. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policies** A dict of IAM role policies.

**policies\_from\_pillars** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies** A list of (AWS or Customer) managed policies to be attached to the role.

**create\_instance\_profile** A boolean of whether or not to create an instance profile and associate it with this role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies** Deletes existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

## 21.19.40 salt.states.boto\_iot module

### Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
 region: us-east-1
```

```
Ensure policy exists:
 boto_iot.policy_present:
 - policyName: mypolicy
 - policyDocument:
 Version: "2012-10-17"
 Statement:
 Action:
 - iot:Publish
 Resource:
 - "*"
 Effect: "Allow"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

```
Ensure topic rule exists:
 boto_iot.topic_rule_present:
 - ruleName: myrule
 - sql: "SELECT * FROM 'iot/test'"
 - description: 'test rule'
 - ruleDisabled: false
 - actions:
 - lambda:
 functionArn: "arn:aws:us-east-1:1234:function/functionname"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_iot.policy_absent`(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

**name** The name of the state definition.

**policyName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_attached`(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.policy_detached(name, policyName, principal, region=None, key=None,
 keyid=None, profile=None)
```

Ensure policy is attached to the given principal.

**name** The name of the state definition.

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.policy_present(name, policyName, policyDocument, region=None,
 key=None, keyid=None, profile=None)
```

Ensure policy exists.

**name** The name of the state definition

**policyName** Name of the policy.

**policyDocument** The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.thing_type_absent(name, thingTypeName, region=None, key=None,
 keyid=None, profile=None)
```

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

**name** The name of the state definition.

**thingTypeName** Name of the thing type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iot.thing_type_present(name, thingTypeName, thingTypeDescription,
 searchableAttributesList, region=None, key=None,
 keyid=None, profile=None)
```

Ensure thing type exists.

New in version 2016.11.0.

**name** The name of the state definition

**thingTypeName** Name of the thing type

**thingTypeDescription** Description of the thing type

**searchableAttributesList** List of string attributes that are searchable for the thing type

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used

**profile** A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

`salt.states.boto_iot.topic_rule_absent`(*name*, *ruleName*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure topic rule with passed properties is absent.

**name** The name of the state definition.

**ruleName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.topic_rule_present`(*name*, *ruleName*, *sql*, *actions*, *description=""*, *ruleDis-*  
*abled=False*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Ensure topic rule exists.

**name** The name of the state definition

**ruleName** Name of the rule.

**sql** The SQL statement used to query the topic.

**actions** The actions associated with the rule.

**description** The description of the rule.

**ruleDisable** Specifies whether the rule is disabled.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.41 salt.states.boto\_kinesis module

### Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkjdfjakghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
 region: us-east-1

```

```

Ensure Kinesis stream does not exist:
boto_kinesis.absent:
 - name: new_stream
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
 - region: us-east-1

```

```

Ensure Kinesis stream exists:
boto_kinesis.present:
 - name: new_stream
 - retention_hours: 168
 - enhanced_monitoring: ['ALL']
 - num_shards: 2
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
 - region: us-east-1

```

`salt.states.boto_kinesis.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Delete the kinesis stream, if it exists.

**name (string)** Stream name

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_kinesis.present` (*name, retention\_hours=None, enhanced\_monitoring=None, num\_shards=None, do\_reshard=True, region=None, key=None, keyid=None, profile=None*)

Ensure the kinesis stream is properly configured and scaled.

**name (string)** Stream name

**retention\_hours (int)** Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

**enhanced\_monitoring (list of string)** Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

**num\_shards (int)** Reshard stream (if necessary) to this number of shards !!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^(N+1) !!!!)

**do\_reshard (boolean)** If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.42 salt.states.boto\_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBj08H
elb.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBj08H
 key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
 region: us-east-1
```

```
Ensure mykey key exists:
 boto_kms.key_present:
 - name: mykey
 - region: us-east-1

Using a profile from pillars
Ensure mykey key exists:
 boto_kms.key_present:
 - name: mykey
 - region: us-east-1
 - profile: myprofile

Passing in a profile
Ensure mykey key exists:
 boto_key.key_present:
 - name: mykey
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBj08H
 key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

```
salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
 grants=None, manage_grants=False, key_rotation=False,
 enabled=True, region=None, key=None, keyid=None, profile=None)
```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

**name** Name of the key.

**policy** Key usage policy.

**description** Description of the key.

**key\_usage** Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT\_DECRYPT, which is also the only supported option.

**grants** A list of grants to apply to the key. Not currently implemented.

**manage\_grants** Whether or not to manage grants. False by default, which will not manage any grants.

**key\_rotation** Whether or not key rotation is enabled for the key. False by default.

**enabled** Whether or not the key is enabled. True by default.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.43 salt.states.boto\_lambda module

#### Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdjkgHWupUjasdfldkflgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdjkgHWupUjasdfldkflgjsdfjajkghs
 region: us-east-1
```

```
Ensure function exists:
 boto_lambda.function_present:
 - FunctionName: myfunction
 - Runtime: python2.7
 - Role: iam_role_name
 - Handler: entry_function
 - ZipFile: code.zip
 - S3Bucket: bucketname
 - S3Key: keyname
 - S3ObjectVersion: version
 - Description: "My Lambda Function"
 - Timeout: 3
 - MemorySize: 128
 - region: us-east-1
```

(continues on next page)

(continued from previous page)

```
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_lambda.alias_absent`(*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**Name** Name of the alias.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present`(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description="*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

**name** The name of the state definition.

**FunctionName** Name of the function for which you want to create an alias.

**Name** The name of the alias to be created.

**FunctionVersion** Function version for which you are creating the alias.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

**name** The name of the state definition.

**EventSourceArn** ARN of the event source.

**FunctionName** Name of the lambda function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_present`(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

**name** The name of the state definition.

**EventSourceArn** The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

**FunctionName** The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

**StartingPosition** The position in the stream where AWS Lambda should start reading. (TRIM\_HORIZON | LATEST)

**Enabled** Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

**BatchSize** The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.function_absent`(*name*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure function with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.function_present`(*name*, *FunctionName*, *Runtime*, *Role*, *Handler*, *ZipFile=None*, *S3Bucket=None*, *S3Key=None*, *S3ObjectVersion=None*, *Description=""*, *Timeout=3*, *MemorySize=128*, *Permissions=None*, *RoleRetries=5*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *VpcConfig=None*, *Environment=None*)

Ensure function exists.

**name** The name of the state definition

**FunctionName** Name of the Function.

**Runtime** The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'

**Role** The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

**Handler** The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.\*export\* value in your function. For Java, it can be package.classname::handler or package.class-name.

**ZipFile** A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

**S3Bucket** Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3Key** The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3ObjectVersion** The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**Timeout** The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time.

The default is 3 seconds.

**MemorySize** The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

**VpcConfig** If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```
VpcConfig:
SecurityGroupNames:
- mysecgroup1
- mysecgroup2
SecurityGroupIds:
- sg-abcdef1234
SubnetNames:
- mysubnet1
SubnetIds:
- subnet-1234abcd
- subnet-abcd1234
```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

**Permissions** A list of permission definitions to be added to the function's policy

**RoleRetries** IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

**Environment** The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
 'Variables': {
 'VariableName': 'VariableValue'
 }
}
```

New in version 2017.7.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.44 salt.states.boto\_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdjkgHWupUjasdfldkflgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdjkgHWupUjasdfldkflgjsdfjajkghs
 region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
boto_lc.present:
 - name: mylc
 - image_id: ami-0b9c9f62
 - key_name: mykey
 - security_groups:
 - mygroup
 - instance_type: m1.small
 - instance_monitoring: true
 - block_device_mappings:
 - '/dev/sda1':
 size: 20
 volume_type: 'io1'
 iops: 220
 delete_on_termination: true
 - cloud_init:
 boothooks:
 'disable-master.sh': |
 #!/bin/bash
 echo "manual" > /etc/init/salt-master.override
 scripts:
 'run_salt.sh': |
 #!/bin/bash

 add-apt-repository -y ppa:saltstack/salt
 apt-get update
 apt-get install -y salt-minion
 salt-call state.highstate
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdjkgHWupUjasdfldkflgjsdfjajkghs

Using a profile from pillars.
Ensure mylc exists:
boto_lc.present:
 - name: mylc
```

(continues on next page)

(continued from previous page)

```

- image_id: ami-0b9c9f62
- profile: myprofile

Passing in a profile.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsd fjkg hWupUjasdf lkd fkl gjsdf j ajkghs
 region: us-east-1

```

**salt.states.boto\_lc.absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

**name** Name of the launch configuration.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_lc.present**(*name*, *image\_id*, *key\_name=None*, *vpc\_id=None*, *vpc\_name=None*, *security\_groups=None*, *user\_data=None*, *cloud\_init=None*, *instance\_type='m1.small'*, *kernel\_id=None*, *ramdisk\_id=None*, *block\_device\_mappings=None*, *delete\_on\_termination=None*, *instance\_monitoring=False*, *spot\_price=None*, *instance\_profile\_name=None*, *ebs\_optimized=False*, *associate\_public\_ip\_address=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the launch configuration exists.

**name** Name of the launch configuration.

**image\_id** AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

**key\_name** Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

**vpc\_id** The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with **vpc\_name**.

**vpc\_name** Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with **vpc\_id**.

**security\_groups** List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

**user\_data** The user data available to launched EC2 instances.

**cloud\_init** A dict of cloud\_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with **user\_data**.

**instance\_type** The instance type. ex: m1.small.

**kernel\_id** The kernel id for the instance.

**ramdisk\_id** The RAM disk ID for the instance.

**block\_device\_mappings** A dict of block device mappings that contains a dict with **volume\_type**, **delete\_on\_termination**, **iops**, **size**, **encrypted**, **snapshot\_id**.

**volume\_type** Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

**delete\_on\_termination** Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.

- iops** For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
- size** Desired volume size (in GiB).
- encrypted** Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.
- instance\_monitoring** Whether instances in group are launched with detailed monitoring.
- spot\_price** The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.
- instance\_profile\_name** The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.
- ebs\_optimized** Specifies whether the instance is optimized for EBS I/O (true) or not (false).
- associate\_public\_ip\_address** Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.
- region** The region to connect to.
- key** Secret key to be used.
- keyid** Access key to be used.
- profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.45 salt.states.boto\_rds

#### Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
Ensure myrds RDS exists:
boto_rds.present:
 - name: myrds
 - allocated_storage: 5
 - storage_type: standard
```

(continues on next page)

(continued from previous page)

```

- db_instance_class: db.t2.micro
- engine: MySQL
- master_username: myuser
- master_user_password: mypass
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfldkfdklgjsdfjajkgHs
- tags:
 key: value

```

```

Ensure parameter group exists:
create-parameter-group:
 boto_rds.parameter_present:
 - name: myparametergroup
 - db_parameter_group_family: mysql5.6
 - description: "parameter group family"
 - parameters:
 - binlog_cache_size: 32768
 - binlog_checksum: CRC32
 - region: eu-west-1

```

depends boto3

`salt.states.boto_rds.absent` (*name*, *skip\_final\_snapshot=None*, *final\_db\_snapshot\_identifier=None*, *tags=None*, *wait\_for\_deletion=True*, *timeout=180*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure RDS instance is absent.

**name** Name of the RDS instance.

**skip\_final\_snapshot** Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

**final\_db\_snapshot\_identifier** If a final snapshot is requested, this is the identifier used for that snapshot.

**tags** A dict of tags.

**wait\_for\_deletion (bool)** Wait for the RDS instance to be deleted completely before finishing the state.

**timeout (in seconds)** The amount of time that can pass before raising an Exception.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.parameter_present` (*name*, *db\_parameter\_group\_family*, *description*, *parameters=None*, *apply\_method='pending-reboot'*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure DB parameter group exists and update parameters.

**name** The name for the parameter group.

**db\_parameter\_group\_family** The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

**description** Parameter group description.

**parameters** The DB parameters that need to be changed of type dictionary.

**apply\_method** The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

**tags** A dict of tags.

**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)
```

Ensure RDS instance exists.

**name** Name of the RDS state definition.

**allocated\_storage** The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db\_instance\_class** The compute and memory capacity of the Amazon RDS DB instance.

**engine** The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master\_username** The name of master user for the client DB instance.

**master\_user\_password** The password for the master database user. Can be any printable ASCII character except `"/", "'",` or `"@"`.

**db\_name** The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create\\_db\\_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage\_type** Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the Iops parameter.

**db\_security\_groups** A list of DB security groups to associate with this DB instance.

**vpc\_security\_group\_ids** A list of EC2 VPC security group IDs to associate with this DB instance.

**vpc\_security\_groups** A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

**availability\_zone** The EC2 Availability Zone that the database instance will be created in.

**db\_subnet\_group\_name** A DB subnet group to associate with this DB instance.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur.

**db\_parameter\_group\_name** A DB parameter group to associate with this DB instance.

**db\_cluster\_identifier** If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

**tde\_credential\_arn** The ARN from the Key Store with which the instance is associated for TDE encryption.

**tde\_credential\_password** The password to use for TDE encryption if an encryption key is not used.

**storage\_encrypted** Specifies whether the DB instance is encrypted.

**kms\_keyid** If `storage_encrypted` is true, the KMS key identifier for the encrypted DB instance.

**backup\_retention\_period** The number of days for which automated backups are retained.

**preferred\_backup\_window** The daily time range during which automated backups are created if automated backups are enabled.

**port** The port number on which the database accepts connections.

**multi\_az** Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.

**engine\_version** The version number of the database engine to use.

**auto\_minor\_version\_upgrade** Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

**license\_model** License model information for this DB instance.

**iops** The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

**option\_group\_name** Indicates that the DB instance should be associated with the specified option group.

**character\_set\_name** For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.

**publicly\_accessible** Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

**wait\_status** Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

**tags** A dict of tags.

**copy\_tags\_to\_snapshot** Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

**region** Region to connect to.

**domain** The identifier of the Active Directory Domain.

**key** AWS secret key to be used.

**keyid** AWS access key to be used.

**monitoring\_interval** The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

**monitoring\_role\_arn** The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

**domain\_iam\_role\_name** Specify the name of the IAM role to be used when making API calls to the Directory Service.

**promotion\_tier** A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
 availability_zone=None, port=None,
 auto_minor_version_upgrade=None, iops=None, op-
 tion_group_name=None, publicly_accessible=None,
 tags=None, region=None, key=None, keyid=None,
 profile=None, db_parameter_group_name=None)

```

Ensure RDS replica exists.

```

Ensure myrds replica RDS exists:
boto_rds.create_replica:
- name: myreplica
- source: mydb

```

```

salt.states.boto_rds.subnet_group_absent(name, tags=None, region=None, key=None,
 keyid=None, profile=None)

```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name** The name for the DB subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**subnet\_names** A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**description** Subnet group description.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.46 salt.states.boto\_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
region: us-east-1
```

```
mycnamerecord:
boto_route53.present:
- name: test.example.com.
- value: my-elb.us-east-1.elb.amazonaws.com.
- zone: example.com.
- ttl: 60
- record_type: CNAME
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

```
Using a profile from pillars
myarecord:
```

(continues on next page)

(continued from previous page)

```

boto_route53.present:
- name: test.example.com.
- value: 1.1.1.1
- zone: example.com.
- ttl: 60
- record_type: A
- region: us-east-1
- profile: myprofile

Passing in a profile
myarecord:
boto_route53.present:
- name: test.example.com.
- value: 1.1.1.1
- zone: example.com.
- ttl: 60
- record_type: A
- region: us-east-1
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgshs

```

`salt.states.boto_route53.absent`(*name, zone, record\_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False*)

Ensure the Route53 record is deleted.

**name** Name of the record.

**zone** The zone to delete the record from.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**identifier** An identifier to match for deletion.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using `split_dns`, specify if this is the private zone.

`salt.states.boto_route53.hosted_zone_absent`(*name, domain\_name=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**domain\_name** The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

`salt.states.boto_route53.hosted_zone_present`(*name, domain\_name=None, private\_zone=False, caller\_ref=None, comment="", vpc\_id=None, vpc\_name=None, vpc\_region=None, region=None, key=None, keyid=None, profile=None*)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- `private_zone` (AWS API limitation).
- `comment` (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).

- `vpc_id` (same story - we really need to rewrite this module with boto3)
- `vpc_name` (really just a pointer to `vpc_id` anyway).
- `vpc_region` (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer `boto3_route53` module instead.

**name** The name of the state definition.

**domain\_name** The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of `name` if not provided.

**private\_zone** Set True if creating a private hosted zone.

**caller\_ref** A unique string that identifies the request and that allows `create_hosted_zone()` calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same `caller_ref`. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

**comment** Any comments you want to include about the hosted zone.

**vpc\_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_name`. Ignored when creating a non-private zone.

**vpc\_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_id`. Ignored when creating a non-private zone.

**vpc\_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from `vpc_id` or `vpc_name`, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```

salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None,
 region=None, key=None, keyid=None, profile=None,
 wait_for_sync=True, split_dns=False, private_zone=False)

```

Ensure the Route53 record is present.

**name** Name of the record.

**value**

**Value of the record. As a special case, you can pass in:** `private:<Name tag>` to have the function autodetermine the private IP `public:<Name tag>` to have the function autodetermine the public IP

**zone** The zone to create the record in.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53 before returning success.

**split\_dns** Route53 supports parallel public and private DNS zones with the same name.

**private\_zone** If using `split_dns`, specify if this is the private zone.

```

salt.states.boto_route53.rr_absent(*args, **kwargs)

```

```

salt.states.boto_route53.rr_present(*args, **kwargs)

```

## 21.19.47 salt.states.boto\_s3\_bucket module

### Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdjkgHWupUjasdfLkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdjkgHWupUjasdfLkdfklgjsdfjajkghs
region: us-east-1
```

```
Ensure bucket exists:

```

`salt.states.boto_s3_bucket.absent`(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

**name** The name of the state definition.

**Bucket** Name of the bucket.

**Force** Empty the bucket first if necessary - Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_s3_bucket.present`(*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket exists.

**name** The name of the state definition

**Bucket** Name of the bucket.

**LocationConstraint** 'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

**ACL** The permissions on a bucket using access control lists (ACL).

**CORSRules** The cors configuration for a bucket.

**LifecycleConfiguration** Lifecycle configuration for your bucket

**Logging** The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

**NotificationConfiguration** notifications of specified events for a bucket

**Policy** Policy on the bucket

**Replication** Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

**RequestPayment** The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

**Tagging** A dictionary of tags that should be set on the bucket

**Versioning** The versioning state of the bucket

**Website** The website configuration of the bucket

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.48 salt.states.boto\_secgroup

## Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
 region: us-east-1
```

```
Ensure mysecgroup exists:
 boto_secgroup.present:
 - name: mysecgroup
 - description: My security group
 - vpc_name: myvpc
 - rules:
 - ip_protocol: tcp
 from_port: 80
 to_port: 80
 cidr_ip:
 - 10.0.0.0/8
 - 192.168.0.0/16
 - ip_protocol: tcp
 from_port: 8080
 to_port: 8090
 cidr_ip:
 - 10.0.0.0/8
 - 192.168.0.0/16
 - ip_protocol: icmp
 from_port: -1
 to_port: -1
 source_group_name: mysecgroup
 - ip_protocol: tcp
 from_port: 8080
 to_port: 8080
 source_group_name: MyOtherSecGroup
 source_group_name_vpc: MyPeeredVPC
 - rules_egress:
 - ip_protocol: all
 from_port: -1
 to_port: -1
 cidr_ip:
 - 10.0.0.0/8
```

(continues on next page)

```

 - 192.168.0.0/16
 - tags:
 SomeTag: 'My Tag Value'
 SomeOtherTag: 'Other Tag Value'
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs

Using a profile from pillars
Ensure mysecgroup exists:
 boto_secgroup.present:
 - name: mysecgroup
 - description: My security group
 - profile: myprofile

Passing in a profile
Ensure mysecgroup exists:
 boto_secgroup.present:
 - name: mysecgroup
 - description: My security group
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs
 region: us-east-1

```

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

```

salt.states.boto_secgroup.absent(name, vpc_id=None, vpc_name=None, region=None,
 key=None, keyid=None, profile=None)

```

Ensure a security group with the specified name does not exist.

**name** Name of the security group.

**vpc\_id** The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

```

salt.states.boto_secgroup.present(name, description, vpc_id=None, vpc_name=None,
 rules=None, rules_egress=None, delete_ingress_rules=True,
 delete_egress_rules=True, region=None, key=None,
 keyid=None, profile=None, tags=None)

```

Ensure the security group exists with the specified rules.

**name** Name of the security group.

**description** A description of this security group.

**vpc\_id** The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

**rules** A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

**rules\_egress** A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

**delete\_ingress\_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to `False` to avoid deleting rules which were added outside of salt.

**delete\_egress\_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to `False` to avoid deleting rules which were added outside of salt.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.

**tags** List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

## 21.19.49 salt.states.boto\_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
mytopic:
 boto_sns.present:
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

Using a profile from pillars
mytopic:
 boto_sns.present:
 - region: us-east-1
 - profile: mysnsprofile
```

(continues on next page)

(continued from previous page)

```
Passing in a profile
mytopic:
 boto_sns.present:
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKRB08H
 key: askdjghsd fjkghWupUj asdf lkd fklgjsdfjajkghs
```

`salt.states.boto_sns.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

**name** Name of the SNS topic.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**unsubscribe** If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present`(*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

**name** Name of the SNS topic.

**subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
 {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
 {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.50 salt.states.boto\_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
myqueue:
 boto_sqs.present:
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 - attributes:
 ReceiveMessageWaitTimeSeconds: 20

Using a profile from pillars
myqueue:
 boto_sqs.present:
 - region: us-east-1
 - profile: mysqsprofile

Passing in a profile
myqueue:
 boto_sqs.present:
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_sqs.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

**name** Name of the SQS queue.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_sqs.present` (*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**attributes** A dict of key/value SQS attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.51 salt.states.boto\_vpc

## Manage VPCs

New in version 2015.8.0.

### depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
region: us-east-1
```

```
aws:
region:
 us-east-1:
 profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
 region: us-east-1
```

```
Ensure VPC exists:
boto_vpc.present:
- name: myvpc
- cidr_block: 10.10.11.0/24
- dns_hostnames: True
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

Ensure subnet exists:
boto_vpc.subnet_present:
- name: mysubnet
- vpc_id: vpc-123456
- cidr_block: 10.0.0.0/16
- region: us-east-1
- profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile') %}
Ensure internet gateway exists:
boto_vpc.internet_gateway_present:
- name: myigw
- vpc_name: myvpc
```

(continues on next page)

(continued from previous page)

```

- profile: {{ profile }}

Ensure route table exists:
boto_vpc.route_table_present:
 - name: my_route_table
 - vpc_id: vpc-123456
 - routes:
 - destination_cidr_block: 0.0.0.0/0
 instance_id: i-123456
 - subnet_names:
 - subnet1
 - subnet2
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
 - conn_name: salt_vpc_peering
 - region: us-west-2
 - require:
 - boto_vpc: request a vpc peering connection

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
 - requester_vpc_id: vpc-4a3d522e
 - peer_vpc_id: vpc-ae81e9ca
 - region: us-west-2
 - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
 - conn_id: pcx-1873c371
 - region: us-west-2

```

VPC peering connections can be deleted, as shown below.

```

delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
 - conn_name: salt_vpc_peering

```

Delete also accepts a VPC peering connection id.

```

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
 - conn_id: pcx-1873c371

```

`salt.states.boto_vpc.absent` (*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

**name** Name of the VPC.

**tags** A list of tags. All tags must match.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.accept_vpc_peering_connection(name=None, conn_id=None,
 conn_name=None, region=None,
 key=None, keyid=None, profile=None)
```

Accept a VPC pending requested peering connection between two VPCs.

**name** Name of this state

**conn\_id** The connection ID to accept. Exclusive with conn\_name. String type.

**conn\_name** The name of the VPC peering connection to accept. Exclusive with conn\_id. String type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
- conn_name: salt_peering_connection

usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
- conn_id: pbx-1873d472
- region: us-west-2
```

```
salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None,
 conn_name=None, region=None,
 key=None, keyid=None, profile=None)
```

**name** Name of the state

**conn\_id** ID of the peering connection to delete. Exclusive with conn\_name.

**conn\_name** The name of the peering connection to delete. Exclusive with conn\_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- region: us-west-2
- conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn\_name and conn\_id will result in an error.

```

delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- conn_name: salt_vpc_peering

```

`salt.states.boto_vpc.dhcp_options_absent` (*name=None, dhcp\_options\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure a set of DHCP options with the given settings exist.

**name** (string) Name of the DHCP options set.

**dhcp\_options\_id** (string) Id of the DHCP options set.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.dhcp_options_present` (*name, dhcp\_options\_id=None, vpc\_name=None, vpc\_id=None, domain\_name=None, domain\_name\_servers=None, ntp\_servers=None, netbios\_name\_servers=None, netbios\_node\_type=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or `dhcp_options_id` param.

**name** (string) Name of the DHCP options.

**vpc\_name** (string) Name of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**vpc\_id** (string) Id of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**domain\_name** (string) Domain name to be associated with this option set.

**domain\_name\_servers** (list of strings) The IP address(es) of up to four domain name servers.

**ntp\_servers** (list of strings) The IP address(es) of up to four desired NTP servers.

**netbios\_name\_servers** (list of strings) The IP address(es) of up to four NetBIOS name servers.

**netbios\_node\_type** (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

**tags** (dict of key:value pairs) A set of tags to be added.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent` (*name, detach=False, region=None, key=None, keyid=None, profile=None*)

Ensure the named internet gateway is absent.

**name** Name of the internet gateway.

**detach** First detach the internet gateway from a VPC, if attached.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present`(*name*, *vpc\_name=None*, *vpc\_id=None*,  
*tags=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure an internet gateway exists.

**name** Name of the internet gateway.

**vpc\_name** Name of the VPC to which the internet gateway should be attached.

**vpc\_id** Id of the VPC to which the internet\_gateway should be attached. Only one of `vpc_name` or `vpc_id` may be provided.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent`(*name=None*, *subnet\_name=None*, *subnet\_id=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*,  
*wait\_for\_delete\_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

**name** Name of the state.

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete\_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.nat_gateway_present`(*name*, *subnet\_name=None*, *subnet\_id=None*, *re-*  
*gion=None*, *key=None*, *keyid=None*, *profile=None*,  
*allocation\_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
- subnet_name: my-subnet
```

**name** Name of the state

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**allocation\_id** If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None,
 dns_hostnames=None, tags=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure VPC exists.

**name** Name of the VPC.

**cidr\_block** The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**instance\_tenancy** Instances launched in this VPC will be in single-tenant or dedicated hardware.

**dns\_support** Indicates whether the DNS resolution is supported for the VPC.

**dns\_hostnames** Indicates whether the instances launched in the VPC get DNS hostnames.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
 requester_vpc_name=None,
 peer_vpc_id=None,
 peer_vpc_name=None,
 conn_name=None,
 peer_owner_id=None, region=None,
 key=None,
 keyid=None, profile=None)
```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with requester\_vpc\_name. String type.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with requester\_vpc\_id. String type.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer\_vpc\_name. String type.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account. Exclusive with peer\_vpc\_id. String type.

**conn\_name** The (optional) name to use for this VPC peering connection. String type.

**peer\_owner\_id** ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

```
salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None, profile=None)
```

Ensure the named route table is absent.

**name** Name of the route table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None,
 routes=None, subnet_ids=None, subnet_names=None, tags=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
- name: my_route_table
- vpc_id: vpc-123456
- routes:
 - destination_cidr_block: 0.0.0.0/0
 internet_gateway_name: InternetGateway
 - destination_cidr_block: 10.10.11.0/24
 instance_id: i-123456
 - destination_cidr_block: 10.10.12.0/24
 interface_id: eni-123456
 - destination_cidr_block: 10.10.13.0/24
 instance_name: mygatewayserver
- subnet_names:
 - subnet1
 - subnet2
```

**name** Name of the route table.

**vpc\_name** Name of the VPC with which the route table should be associated.

**vpc\_id** Id of the VPC with which the route table should be associated. Either vpc\_name or vpc\_id must be provided.

**routes** A list of routes. Each route has a cidr and a target.

**subnet\_ids** A list of subnet ids to associate

**subnet\_names** A list of subnet names to associate

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.subnet_absent(name=None, subnet_id=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure subnet with passed properties is absent.

**name** Name of the subnet.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_vpc.subnet_present(name, cidr_block, vpc_name=None, vpc_id=None,
 availability_zone=None, tags=None, re-
 gion=None, key=None, keyid=None, profile=None,
 route_table_id=None, route_table_name=None,
 auto_assign_public_ipv4=False)

```

Ensure a subnet exists.

**name** Name of the subnet.

**cidr\_block** The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**vpc\_name** Name of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**vpc\_id** Id of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**availability\_zone** AZ in which the subnet should be placed.

**tags** A list of tags.

**route\_table\_id** A route table ID to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**route\_table\_name** A route table name to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_vpc.vpc_peering_connection_absent(name, conn_id=None,
 conn_name=None, region=None,
 key=None, keyid=None, pro-
 file=None)

```

```

salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None,
 requester_vpc_name=None,
 peer_vpc_id=None,
 peer_vpc_name=None,
 conn_name=None,
 peer_owner_id=None, re-
 gion=None, key=None,
 keyid=None, profile=None)

```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with requester\_vpc\_name.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with requester\_vpc\_id.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer\_vpc\_name.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer\_vpc\_id.

**conn\_name** The name to use for this VPC peering connection.

**peer\_owner\_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
 boto_vpc.vpc_peering_connection_present:
 - requester_vpc_name: my_local_vpc
 - peer_vpc_name: some_other_guys_vpc
 - conn_name: peering_from_here_to_there
 - peer_owner_id: 012345654321
```

## 21.19.52 salt.states.bower

### Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```
npm:
 pkg.installed
git:
 pkg.installed
bower:
 npm.installed
 require:
 - pkg: npm
 - pkg: git

underscore:
 bower.installed:
 - dir: /path/to/project
 - require:
 - npm: bower
```

**salt.states.bower.bootstrap**(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.

**user** The user to run Bower with

**salt.states.bower.installed**(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
underscore:
 bower.installed:
 - dir: /path/to/project
 - user: someuser

jquery#2.0:
 bower.installed:
 - dir: /path/to/project
```

**name** The package to install

**dir** The target directory in which to install the package

**pkgs** A list of packages to install with a single Bower invocation; specifying this argument will ignore the `name` argument

**user** The user to run Bower with

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.pruned` (*name*, *user=None*, *env=None*)

New in version 2017.7.0.

Cleans up local `bower_components` directory.

Will execute 'bower prune' on the specified directory (param: `name`)

**user** The user to run Bower with

`salt.states.bower.removed` (*name*, *dir*, *user=None*)

Verify that the given package is not installed.

**dir** The target directory in which to install the package

**user** The user to run Bower with

### 21.19.53 salt.states.cabal

#### Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that `cabal-install` must be installed for these states to be available, so cabal states should include a requisite to a `pkg.installed` state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

```
cabal-install: pkg.installed
```

```
ShellCheck:
```

```
 cabal.installed:
```

- require: - pkg: cabal-install

`salt.states.cabal.installed` (*name*, *pkgs=None*, *user=None*, *install\_global=False*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
ShellCheck-0.3.5:
```

```
 cabal:
```

```
 - installed:
```

**name** The package to install

**user** The user to run cabal install with

**install\_global** Install package globally instead of locally

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed` (*name*, *user=None*, *env=None*)

Verify that given package is not installed.

### 21.19.54 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum`(*name*, *\*\*kwargs*)

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
 sesceph.quorum:
 - require:
 - sesceph: mon_running
```

## 21.19.55 salt.states.chef

### Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
 chef.client:
 - override-runlist: 'demo1,demo2'
 - server: 'https://chef.domain.com'

default-chef-run:
 chef.client: []

my-solo-run:
 chef.solo:
 - environment: dev
```

`salt.states.chef.client`(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**server** The chef server URL

**client\_key** Set the client key file location

**config** The configuration file to use

**config-file-jail** Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

**environment** Set the Chef Environment on the node

**group** Group to set privilege to

**json-attributes** Load attributes from a JSON file or URL

**localmode** Point chef-client at local repository if True

**log\_level** Set the log level (debug, info, warn, error, fatal)

**logfile** Set the log file location

**node-name** The node name for this client

**override-runlist** Replace current run list with specified items for a single run

**pid** Set the PID file location, defaults to /tmp/chef-client.pid

**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.

**runlist** Permanently replace current run list with specified items

**user** User to set privilege to

**validation\_key** Set the validation key file location, used for registering new clients

`salt.states.chef.solo`(*name*, *\*\*kwargs*)

**name** Unique identifier for the state. Does not affect the Chef run.

**config** The configuration file to use  
**environment** Set the Chef Environment on the node  
**group** Group to set privilege to  
**json-attributes** Load attributes from a JSON file or URL  
**log\_level** Set the log level (debug, info, warn, error, fatal)  
**logfile** Set the log file location  
**node-name** The node name for this client  
**override-runlist** Replace current run list with specified items for a single run  
**recipe-url** Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache  
**run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.  
**user** User to set privilege to

### 21.19.56 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

---

**Note:** Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

---

```

salt.states.chocolatey.installed(name, version=None, source=None, force=False,
 pre_versions=False, install_args=None, override_args=False,
 force_x86=False, package_args=None, allow_multiple=False)

```

Installs a package if not already installed

#### Parameters

- **name** (*str*) – The name of the package to be installed. Required.
- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) – Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre\_versions** (*bool*) – Include pre-release packages. Default is False.
- **install\_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override\_args** (*bool*) – Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments. Default is False.
- **force\_x86** (*bool*) – Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package\_args** (*str*) – Arguments you want to pass to the package. Default is None.
- **allow\_multiple** (*bool*) – Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

New in version 2017.7.0.

```

Installsomepackage:
chocolatey.installed:
- name: packagename
- version: '12.04'

```

(continues on next page)

(continued from previous page)

```
- source: 'mychocolatey/source'
- force: True
```

```
salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None,
 override_args=False)
```

Uninstalls a package

**name** The name of the package to be uninstalled

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall\_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override\_args** Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

```
salt.states.chocolatey.upgraded(name, version=None, source=None, force=False,
 pre_versions=False, install_args=None, override_args=False,
 force_x86=False, package_args=None)
```

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.

#### Parameters

- **name** (*str*) – The name of the package to be installed. Required.
- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is None.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) – True will reinstall an existing package with the same version. Default is False.
- **pre\_versions** (*bool*) – True will include pre-release packages. Default is False.
- **install\_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override\_args** (*bool*) – True will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. False will append `install_args` to the end of the default arguments. Default is False.
- **force\_x86** (*bool*) – True forces 32bit installation on 64 bit systems. Default is False.
- **package\_args** (*str*) – Arguments you want to pass to the package. Default is None.

```
upgrade_some_package:
 chocolatey.upgraded:
 - name: packagename
 - version: '12.04'
 - source: 'mychocolatey/source'
```

## 21.19.57 salt.states.chronos\_job module

Configure Chronos jobs via a salt proxy.

```

my_job:
 chronos_job.config:
 - config:
 schedule: "R//PT2S"
 command: "echo 'hi'"
 owner: "me@example.com"

```

New in version 2015.8.2.

`salt.states.chronos_job.absent(name)`

Ensure that the chronos job with the given name is not present.

**Parameters** **name** – The app name

**Returns** A standard Salt changes dictionary

`salt.states.chronos_job.config(name, config)`

Ensure that the chronos job with the given name is present and is configured to match the given config values.

**Parameters**

- **name** – The job name

- **config** – The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

### 21.19.58 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

**codeauthor** Spencer Ervin <spencer\_ervin@hotmail.com>

**maturity** new

**depends** none

**platform** unix

#### About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

**See also:**

*CIMC Proxy Module*

`salt.states.cimc.hostname(name, hostname=None)`

Ensures that the hostname is set to the specified value.

New in version 2019.2.0.

**name:** The name of the module function to execute.

**hostname(str):** The hostname of the server.

**SLS Example:**

```

set_name:
 cimc.hostname:
 - hostname: foobar

```

`salt.states.cimc.logging_levels` (*name*, *remote=None*, *local=None*)

Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*remote*(str): The logging level for SYSLOG logs.

*local*(str): The logging level for the local device.

SLS Example:

```
logging_levels:
 cimc.logging_levels:
 - remote: informational
 - local: notice
```

`salt.states.cimc.ntp` (*name*, *servers*)

Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

*name*: The name of the module function to execute.

*servers*(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

```
ntp_configuration_list:
 cimc.ntp:
 - servers:
 - foo.bar.com
 - 10.10.10.10

ntp_configuration_str:
 cimc.ntp:
 - servers: foo.bar.com
```

`salt.states.cimc.power_configuration` (*name*, *policy=None*, *delayType=None*, *delay-Value=None*)

Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*policy*(str): The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:

reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.

stay-off: The server remains off until it is manually restarted.

last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.

*delayType*(str): If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:

fixed: The server restarts after a fixed delay.

random: The server restarts after a random delay.

`delayValue(int)`: If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

```
reset_power:
 cimc.power_configuration:
 - policy: reset
 - delayType: fixed
 - delayValue: 0

power_off:
 cimc.power_configuration:
 - policy: stay-off
```

`salt.states.cimc.syslog` (*name*, *primary=None*, *secondary=None*)

Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

*name*: The name of the module function to execute.

*primary(str)*: The IP address or FQDN of the primary syslog server.

*secondary(str)*: The IP address or FQDN of the secondary syslog server.

SLS Example:

```
syslog_configuration:
 cimc.syslog:
 - primary: 10.10.10.10
 - secondary: foo.bar.com
```

`salt.states.cimc.user` (*name*, *id=*”, *user=*”, *priv=*”, *password=*”, *status='active'*)

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*id(int)*: The user ID slot on the device.

*user(str)*: The username of the user.

*priv(str)*: The privilege level of the user.

*password(str)*: The password of the user.

*status(str)*: The status of the user. Can be either active or inactive.

SLS Example:

```
user_configuration:
 cimc.user:
 - id: 11
 - user: foo
 - priv: admin
 - password: mypassword
 - status: active
```

### 21.19.59 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.states.cisconso.value_present` (*name, datastore, path, config*)

Ensure a specific value exists at a given path

#### Parameters

- **name** (str) – The name for this rule
- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) – The device path to set the value at, a list of element names in order, / separated
- **config** (dict) – The new value at the given path

Examples:

```
enable pap auth:
 cisconso.config_present:
 - name: enable_pap_auth
 - datastore: running
 - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
 - config:
 authentication:
 method: pap
 "list-name": foobar
```

### 21.19.60 salt.states.cloud

#### Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
 cloud.profile:
 my-ec2-config
```

`salt.states.cloud.absent` (*name, onlyif=None, unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

**name** The name of the instance to destroy

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

`salt.states.cloud.present` (*name, cloud\_provider, onlyif=None, unless=None, opts=None, \*\*kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name** The name of the instance to create

**cloud\_provider** The name of the cloud provider to use  
**onlyif** Do run the state only if is unless succeed  
**unless** Do not run the state at least unless succeed  
**opts** Any extra opts that need to be used

`salt.states.cloud.profile`(*name, profile, onlyif=None, unless=None, opts=None, \*\*kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name** The name of the instance to create  
**profile** The name of the cloud profile to use  
**onlyif** Do run the state only if is unless succeed  
**unless** Do not run the state at least unless succeed  
**kwargs** Any profile override or addition  
**opts** Any extra opts that need to be used

`salt.states.cloud.volume_absent`(*name, provider=None, \*\*kwargs*)

Check that a block volume exists.

`salt.states.cloud.volume_attached`(*name, server\_name, provider=None, \*\*kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached`(*name, server\_name=None, provider=None, \*\*kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present`(*name, provider=None, \*\*kwargs*)

Check that a block volume exists.

## 21.19.61 salt.states.cmd

### Execution of arbitrary commands

The `cmd` state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
Store the current date in a file
'date > /tmp/salt-run':
 cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/:
 cmd.run:
 - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
 cmd.run:
 - creates: /tmp/foo
```

creates also accepts a list of files:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
cmd.run:
- creates:
 - /tmp/bar
 - /tmp/baz
```

---

**Note:** The `creates` option was added to version 2014.7.0

---

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
cmd.run:
- name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the `stateful` argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

### Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a `stateful` command:

```
#!/bin/bash
#
echo "Working hard..."

writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
 cmd.run:
 - name: /path/to/myscript
 - cwd: /
 - stateful: True

Run only if myscript changed something:
 cmd.run:
 - name: echo hello
 - cwd: /
 - onchanges:
 - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

#### 4. The `stateful` argument can optionally include a `test_name` parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
 cmd.run:
 - name: /path/to/myscript
 - cwd: /
 - stateful:
 - test_name: /path/to/myscript test

Run masterscript:
 cmd.script:
 - name: masterscript
 - source: salt://path/to/masterscript
 - cwd: /
 - stateful:
 - test_name: masterscript test
```

### Should I use `cmd.run` or `cmd.wait`?

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after

some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
cmd.wait:
- watch:
- pkg: mycustompkg
file.managed:
- source: salt://utils/scripts/postinstall.sh

mycustompkg:
pkg.installed:
- require:
- file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
cmd.run:
- onchanges:
- pkg: mycustompkg
file.managed:
- source: salt://utils/scripts/postinstall.sh

mycustompkg:
pkg.installed:
- require:
- file: /usr/local/bin/postinstall.sh
```

### How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
cmd.run:
- env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.call`(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, out-put\_loglevel='debug', hide\_output=False, use\_vt=False, \*\*kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments (`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
 'name': name
 'changes': {'retval': result},
 'result': True if result is None else bool(result),
 'comment': result if isinstance(result, six.string_types) else ''
}
```

`salt.states.cmd.mod_run_check`(*cmd\_kwargs*, *onlyif*, *unless*, *creates*)

Execute the `onlyif` and `unless` logic. Return a result dict if: \* `onlyif` failed (`onlyif != 0`) \* `unless` succeeded (`unless == 0`) else return `True`

`salt.states.cmd.mod_watch`(*name*, *\*\*kwargs*)

Execute a `cmd` function based on a `watch` call

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.cmd.run`(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *prepend\_path=None*, *stateful=False*, *umask=None*, *output\_loglevel='debug'*, *hide\_output=False*, *timeout=None*, *ignore\_timeout=False*, *use\_vt=False*, *success\_retcodes=None*, *\*\*kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns a zero exit status

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns a non-zero exit status

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
 cmd.run:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
 cmd.run:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**prepend\_path** \$PATH segment to prepend (trailing ':' not necessary) to \$PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**umask** The umask (in octal) to use when running the command.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**quiet** This option no longer has any functionality and will be removed, please set `output_loglevel` to `quiet` to suppress logging of the command.

Deprecated since version 2014.1.0.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

**ignore\_timeout** Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

**creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

**use\_vt** [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**bg** [False] If `True`, run command in background and do not await or deliver its results.

New in version 2016.3.6.

**success\_retcodes:** This parameter will be allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

---

**Note:** `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
 cmd.run:
```

(continues on next page)

(continued from previous page)

```

- name: /usr/bin/python /usr/local/sbin/get-pip.py
- unless: which pip
- require:
 - pkg: python
 - file: /usr/local/sbin/get-pip.py
- reload_modules: True

```

`salt.states.cmd.script` (*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *timeout=None*, *use\_vt=False*, *output\_loglevel='debug'*, *hide\_output=False*, *defaults=None*, *context=None*, *success\_retcodes=None*, *\*\*kwargs*)

Download a script and execute it with specified arguments.

**source** The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently `jinja`, `mako`, and `wempy` are supported

**name** Either `"cmd arg1 arg2 arg3..."` (`cmd` is not used) or a source `"salt://..."`.

**onlyif** Run the named command only if the command passed to the `onlyif` option returns true

**unless** Run the named command only if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The name of the user to run the command as

**shell** The shell to use for execution. The default is set in `grains['shell']`

**env** A list of environment variables to be set prior to execution. Example:

```

salt://scripts/foo.sh:
 cmd.script:
 - env:
 - BATCH: 'yes'

```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```

salt://scripts/bar.sh:
 cmd.script:
 - env: "PATH=/some/path:$PATH"

```

One can still use the existing `$PATH` by using a bit of Jinja:

```

{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

```

**saltenv** [base] The Salt environment to use

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

**args** String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

**creates** Only run if the file or files specified by **creates** do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**context** New in version 2016.3.0.

Overrides default context variables passed to the template.

**defaults** New in version 2016.3.0.

Default context passed to the template.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**success\_retcodes:** This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None,
 shell=None, env=(), stateful=False, umask=None, output_loglevel='debug',
 hide_output=False, use_vt=False, success_retcodes=None, **kwargs)
```

Run the given command only if the watch statement calls it.

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

**unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to `/bin/sh`

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
 cmd.wait:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
 cmd.wait:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the "Stateful" Argument](#) section.

**creates** Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**success\_retcodes:** This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```
salt.states.cmd.wait_call(name, func, args=(), kws=None, onlyif=None, unless=None, creates=None,
 stateful=False, use_vt=False, output_loglevel='debug', hide_output=False,
 **kwargs)
```

```
salt.states.cmd.wait_script(name, source=None, template=None, onlyif=None, unless=None,
 cwd=None, runas=None, shell=None, env=None, stateful=False,
 umask=None, use_vt=False, output_loglevel='debug',
 hide_output=False, **kwargs)
```

Download a script from a remote source and execute it only if a watch statement calls it.

- source** The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- template** If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported
- name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.
- onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true
- unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false
- cwd** The current working directory to execute the command in, defaults to `/root`
- runas** The user name to run the command as
- shell** The shell to use for execution, defaults to the shell grain
- env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
 cmd.wait_script:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
 cmd.wait_script:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- umask** The umask (in octal) to use when running the command.
- stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.
- use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_logLevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**success\_retcodes:** This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

## 21.19.62 salt.states.composer

### Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```

get-composer:
 cmd.run:
 - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
 - unless: test -f /usr/local/bin/composer
 - cwd: /root/

install-composer:
 cmd.wait:
 - name: mv /root/composer.phar /usr/local/bin/composer
 - cwd: /root/
 - watch:
 - cmd: get-composer

/path/to/project:
 composer.installed:
 - no_dev: true
 - require:
 - cmd: install-composer

Without composer installed in your PATH
Note: composer.phar must be executable for state to work properly
/path/to/project:
 composer.installed:
 - composer: /path/to/composer.phar
 - php: /usr/local/bin/php
 - no_dev: true

```

`salt.states.composer.installed`(*name*, *composer=None*, *php=None*, *user=None*, *prefer\_source=None*, *prefer\_dist=None*, *no\_scripts=None*, *no\_plugins=None*, *optimize=None*, *no\_dev=None*, *quiet=False*, *composer\_home='/root'*, *always\_check=True*, *env=None*)

Verify that the correct versions of composer dependencies are present.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** --prefer-source option of composer.  
**prefer\_dist** --prefer-dist option of composer.  
**no\_scripts** --no-scripts option of composer.  
**no\_plugins** --no-plugins option of composer.  
**optimize** --optimize-autoloader option of composer. Recommended for production.  
**no\_dev** --no-dev option for composer. Recommended for production.  
**quiet** --quiet option for composer. Whether or not to return output from composer.  
**composer\_home** \$COMPOSER\_HOME environment variable  
**always\_check** If True, *always* run `composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.  
**env** A list of environment variables to be set prior to execution.

`salt.states.composer.update`(*name*, *composer=None*, *php=None*, *user=None*, *prefer\_source=None*, *prefer\_dist=None*, *no\_scripts=None*, *no\_plugins=None*, *optimize=None*, *no\_dev=None*, *quiet=False*, *composer\_home='/root'*, *env=None*)

Composer update the directory to ensure we have the latest versions of all project dependencies.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the `php` executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** --prefer-source option of composer.

**prefer\_dist** --prefer-dist option of composer.

**no\_scripts** --no-scripts option of composer.

**no\_plugins** --no-plugins option of composer.

**optimize** --optimize-autoloader option of composer. Recommended for production.

**no\_dev** --no-dev option for composer. Recommended for production.

**quiet** --quiet option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable

**env** A list of environment variables to be set prior to execution.

### 21.19.63 salt.states.cron

#### Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

**Warning:** Any timing arguments not specified take a value of `*`. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x` minutes very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```

/path/to/cron/script:
cron.present:
- user: root
- minute: random
- hour: 2

```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `'@reboot'` or `'@hourly'`. Quotes must be used, otherwise PyYAML will strip the `'@'` sign.

```

/path/to/cron/script:
cron.present:
- user: root
- special: '@hourly'

```

The script will be executed every reboot if cron daemon support this option.

```

/path/to/cron/otherscript:
cron.absent:
- user: root
- special: '@daily'

```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.absent` (*name*, *user*='root', *identifier*=False, *special*=None, *\*\*kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

**name** The command that should be absent in the user crontab.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

**special** The special keyword used in the job (eg. `@reboot`, `@hourly`...). Quotes must be used, otherwise PyYAML will strip the `'@'` sign.

`salt.states.cron.env_absent` (*name*, *user*='root')

Verifies that the specified environment variable is absent from the crontab for the specified user

**name** The name of the environment variable to remove from the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.env_present` (*name*, *value*=None, *user*='root')

Verifies that the specified environment variable is present in the crontab for the specified user.

**name** The name of the environment variable to set in the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**value** The value to set for the given environment variable

`salt.states.cron.file` (*name*, *source\_hash*="", *source\_hash\_name*=None, *user*='root', *template*=None, *context*=None, *replace*=True, *defaults*=None, *backup*="", *\*\*kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

**name** The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

**source\_hash** This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
 cron.file:
 - name: https://mydomain.tld/dir2/foo.txt
 - source_hash: https://mydomain.tld/hashes
 - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**user** The user to whom the crontab should be assigned. This defaults to root.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

**context** Overrides default context variables passed to the template.

**replace** If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for the user's crontab.

**salt.states.cron.present**(*name*, *user*='root', *minute*='\*', *hour*='\*', *daymonth*='\*', *month*='\*', *dayweek*='\*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. It is recommended to use *identifier*. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

**name** The command that should be executed by the cron job.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**minute** The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is \*

**hour** The information to be set in the hour section. Default is \*

**daymonth** The information to be set in the day of month section. Default is \*

**month** The information to be set in the month section. Default is \*

**dayweek** The information to be set in the day of week section. Default is \*

**comment** User comment to be added on line previous the cron job

**commented** The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

**special** A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

## 21.19.64 salt.states.csf module

### CSF Ip tables management

**depends**

- csf utility

**configuration** See <http://download.configserver.com/csf/install.txt> for setup instructions.

#### Simply allow/deny rules:

**csf.rule\_present:**

**ip:** 1.2.3.4

**method:** allow

**salt.states.csf.nics\_skip**(*name, nics, ipv6*)

Alias for *csf.nics\_skipped*

**salt.states.csf.nics\_skipped**(*name, nics, ipv6=False*)

**name** Meaningless arg, but required for state.

**nics** A list of nics to skip.

**ipv6** Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

**salt.states.csf.option\_present**(*name, value, reload=False*)

Ensure the state of a particular option/setting in csf.

**name** The option name in csf.conf

**value** The value it should be set to.

**reload** Boolean. If set to true, csf will be reloaded after.

**salt.states.csf.ports\_open**(*name, ports, proto='tcp', direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP\_IN in the csf.conf file.

**ports** A list of ports that should be open.

**proto** The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

**direction** Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

**salt.states.csf.rule\_absent**(*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, reload=False*)

Ensure iptable is not present.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, *csf.tempallow()* or *csf.tempdeny()* are used.

**reload** Reload the csf service after applying this rule. Default false.

```
salt.states.csf.rule_present(name, method, port=None, proto='tcp', direction='in',
 port_origin='d', ip_origin='s', ttl=None, comment="", reload=False)
```

Ensure iptable rule exists.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, *csf.tempallow()* or *csf.tempdeny()* are used.

**comment** An optional comment to appear after the rule as a #comment .

**reload** Reload the csf service after applying this rule. Default false.

```
salt.states.csf.testing_off(name, reload=False)
```

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

```
salt.states.csf.testing_on(name, reload=False)
```

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

### 21.19.65 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
 cyg.installed
```

```
class salt.states.cyg.DictDiffer(current_dict, past_dict)
```

Calculate the difference between two dictionaries.

(1) items added

(2) items removed

(3) keys same in both but changed values

(4) keys same in both and unchanged values

**added()**

Return a set of additions to past\_dict.

**changed()**

Return a set of the keys with changed values.

**removed()**

Return a set of things removed from past\_dict.

**same()**

True if the two dicts are the same.

**unchanged()**

Return a set of the keys with unchanged values.

`salt.states.cyg.installed`(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is installed.

**name** The name of the package to install

**cyg\_arch** [x86\_64] The cygwin architecture to install the package into. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
 cyg.installed:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.removed`(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**cyg\_arch** [x86\_64] The cygwin architecture to remove the package from. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
 cyg.removed:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.updated`(*name*=None, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure all packages are up to date.

**name** [None] No affect, salt fails poorly without the arg available

**cyg\_arch** [x86\_64] The cygwin architecture to update. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
 cyg.updated:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

## 21.19.66 salt.states.ddns

### Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

**depends**

- `dnspython`

---

**Note:** The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

---

Example:

```

webserver:
 ddns.present:
 - zone: example.com
 - ttl: 60
 - data: 111.222.333.444
 - nameserver: 123.234.345.456
 - keyfile: /srv/salt/dnspsy_tsig_key.txt

```

`salt.states.ddns.absent` (*name, zone, data=None, rdtype=None, \*\*kwargs*)

Ensures that the named DNS record is absent.

**name** The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check

**data** Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

**rdtype** DNS resource type. If omitted, all types will be purged.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

`salt.states.ddns.present` (*name, zone, ttl, data, rdtype='A', \*\*kwargs*)

Ensures that the named DNS record is present with the given ttl.

**name** The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check/update

**ttl** TTL for the record

**data** Data for the DNS record. E.g., the IP address for an A record.

**rdtype** DNS resource type. Default 'A'.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

## 21.19.67 salt.states.debconfmod

### Management of debconf selections

#### depends

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of `debconf` selections, this state can set those selections prior to package installation.

### Available Functions

The `debconfmod` state has two functions, the `set` and `set_file` functions

**set** Set `debconf` selections from the state itself

**set\_file** Set `debconf` selections from a file

```

nullmailer-debconf:
 debconf.set:
 - name: nullmailer
 - data:
 'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
 'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
 debconf.set:
 - name: ferm
 - data:
 'ferm/enable': {'type': 'boolean', 'value': True}

```

Note: Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

`salt.states.debconfmod.set`(*name*, *data*, *\*\*kwargs*)  
Set debconf selections

```

<state_id>:
 debconf.set:
 - name: <name>
 - data:
 <question>: {'type': <type>, 'value': <value>}
 <question>: {'type': <type>, 'value': <value>}

<state_id>:
 debconf.set:
 - name: <name>
 - data:
 <question>: {'type': <type>, 'value': <value>}
 <question>: {'type': <type>, 'value': <value>}

```

**name:** The package name to set answers for.

**data:** A set of questions/answers for debconf. Note that everything under this must be indented twice.

**question:** The question the is being pre-answered

**type:** The type of question that is being asked (string, boolean, select, etc.)

**value:** The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, *\*\*kwargs*)  
Set debconf selections from a file or a template

```

<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections

<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections.jinja2
 - template: jinja
 - context:
 some_value: "false"

```

**source:** The location of the file containing the package selections  
**template** If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported  
**context** Overrides default context variables passed to the template.  
**defaults** Default context passed to the template.

### 21.19.68 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
 dellchassis.chassis:
 - chassis_name: my-dell-chassis
 - datacenter: dc-1-us
 - location: my-location
 - mode: 2
 - idrac_launch: 1
 - slot_names:
 - server-1: my-slot-name
 - server-2: my-other-slot-name
 - blade_power_states:
 - server-1: on
 - server-2: off
 - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
 host: 10.27.20.18
 admin_username: root
 fallback_admin_username: root
 passwords:
 - super-secret
 - old-secret
 proxytype: fx2

chassis:
 name: fx2-1
 username: root
 password: saltstack1
 datacenter: london
 location: rack-1-shelf-3
 management_mode: 2
 idrac_launch: 0
 slot_names:
 - 'server-1': blade1
 - 'server-2': blade2

servers:
 server-1:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.132
```

(continues on next page)

(continued from previous page)

```

 netmask: 255.255.0.0
 gateway: 172.17.17.1
server-2:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.2
 netmask: 255.255.0.0
 gateway: 172.17.17.1
server-3:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.20
 netmask: 255.255.0.0
 gateway: 172.17.17.1
server-4:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.2
 netmask: 255.255.0.0
 gateway: 172.17.17.1

switches:
switch-1:
 ip: 192.168.1.2
 netmask: 255.255.255.0
 gateway: 192.168.1.1
 snmp: nonpublic
 password: saltstack1
switch-2:
 ip: 192.168.1.3
 netmask: 255.255.255.0
 gateway: 192.168.1.1
 snmp: nonpublic
 password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
 dellchassis.chassis:
 - name: {{ details['name'] }}
 - location: {{ details['location'] }}
 - mode: {{ details['management_mode'] }}
 - idrac_launch: {{ details['idrac_launch'] }}
 - slot_names:
 {% for entry details['slot_names'] %}
 - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
 {% endfor %}

blade_powercycle:
 dellchassis.chassis:
 - blade_power_states:
 - server-1: powercycle
 - server-2: powercycle
 - server-3: powercycle
 - server-4: powercycle

```

(continues on next page)

(continued from previous page)

```
Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
 dellchassis.blade_idrac:
 - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
 dellchassis.switch:
 - name: {{ k }}
 - ip: {{ v['ip'] }}
 - netmask: {{ v['netmask'] }}
 - gateway: {{ v['gateway'] }}
 - password: {{ v['password'] }}
 - snmp: {{ v['snmp'] }}
{% endfor %}
```

**Note:** This state module relies on the drac.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chassis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```
salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
 idrac_ip=None, idrac_netmask=None,
 idrac_gateway=None, idrac_dnsname=None,
 idrac_dhcp=None)
```

Set parameters for iDRAC in a blade.

#### Parameters

- **idrac\_password** – Password to use to connect to the iDRACs directly (idrac\_ipmi and idrac\_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac\_ipmi** – Enable/Disable IPMI over LAN
- **idrac\_ip** – Set IP address for iDRAC
- **idrac\_netmask** – Set netmask for iDRAC
- **idrac\_gateway** – Set gateway for iDRAC
- **idrac\_dhcp** – Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

**Returns** A standard Salt changes dictionary

**NOTE:** If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

```
salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None, location=None, mode=None, idrac_launch=None, slot_names=None, blade_power_states=None)
```

Manage a Dell Chassis.

**chassis\_name** The name of the chassis.

**datacenter** The datacenter in which the chassis is located

**location** The location of the chassis.

**password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

**mode** The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

**idrac\_launch** The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot\_names** The names of the slots, provided as a list identified by their slot numbers.

**blade\_power\_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
 dellchassis.chassis:
 - chassis_name: my-dell-chassis
 - location: my-location
 - datacenter: london
 - mode: 2
 - idrac_launch: 1
 - slot_names:
 - 1: my-slot-name
 - 2: my-other-slot-name
 - blade_power_states:
 - server-1: on
 - server-2: off
 - server-3: powercycle
```

```
salt.states.dellchassis.firmware_update(hosts=None, directory="")
```

State to update the firmware on host using the `racadm` command

**firmwarefile** filename (string) starting with `salt://`

**host** string representing the hostname supplied to the `racadm` command

**directory** Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
 dellchassis.firmware_update:
 hosts:
 cmc:
 salt://firmware_cmc.exe
 server-1:
 salt://firmware.exe
 directory: /opt/firmwares
```

`salt.states.dellchassis.switch` (*name*, *ip=None*, *netmask=None*, *gateway=None*, *dhcp=None*, *password=None*, *snmp=None*)

Manage switches in a Dell Chassis.

**name** The switch designation (e.g. switch-1, switch-2)

**ip** The Static IP Address of the switch

**netmask** The netmask for the static IP

**gateway** The gateway for the static IP

**dhcp** True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

**password** The access (root) password for the switch

**snmp** The SNMP community string for the switch

Example:

```
my-dell-chassis:
 dellchassis.switch:
 - switch: switch-1
 - ip: 192.168.1.1
 - netmask: 255.255.255.0
 - gateway: 192.168.1.254
 - dhcp: True
 - password: secret
 - snmp: public
```

### 21.19.69 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
 disk.status:
 - name: /dev/xda1
 - maximum: 79%
 - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
 disk.status:
 - name: /dev/xda1
 - maximum: 97%

clear_cache:
 cmd.run:
 - name: rm -r /var/cache/app
 - onfail:
 - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:
 disk.status:
 - name: /dev/xda1
```

(continues on next page)

(continued from previous page)

- **minimum:** 1024 KB
- **maximum:** 1048576 KB
- **absolute:** True

`salt.states.disk.status` (*name, maximum=None, minimum=None, absolute=False*)

Return the current disk usage stats for the named mount point

**name** Disk mount with which to check used space

**maximum** The maximum disk utilization

**minimum** The minimum disk utilization

**absolute** By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

### 21.19.70 salt.states.docker\_container

Management of Docker containers

New in version 2017.7.0.

**depends** `docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq 1.6.0$  are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `NONE`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_container.absent` (*name, force=False*)

Ensure that a container is absent

**name** Name of the container

**force** [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
 docker_container.absent
```

(continues on next page)

(continued from previous page)

```

multiple_containers:
 docker_container.absent:
 - names:
 - foo
 - bar
 - baz

```

`salt.states.docker_container.mod_run_check` (*onlyif*, *unless*, *creates*)

Execute the *onlyif*/*unless*/*creates* logic. Returns a result dict if any of the checks fail, otherwise returns True

`salt.states.docker_container.mod_watch` (*name*, *sfun=None*, *\*\*kwargs*)

The `docker_container` watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.docker_container.run` (*name*, *image=None*, *onlyif=None*, *unless=None*, *creates=None*, *bg=False*, *failhard=True*, *replace=False*, *force=False*, *skip\_translate=None*, *ignore\_collisions=False*, *validate\_ip\_addrs=True*, *client\_timeout=60*, *\*\*kwargs*)

New in version 2018.3.0.

---

**Note:** If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is not implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

---

Like the `cmd.run` state, only for Docker. Does the equivalent of a `docker run` and returns information about the container that was created, as well as its output.

This state accepts the same arguments as `docker_container.running`, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

**onlyif** A command or list of commands to run as a check. The container will only run if any of the specified commands returns a zero exit status.

**unless** A command or list of commands to run as a check. The container will only run if any of the specified commands returns a non-zero exit status.

**creates** A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.

**bg** [False] If True, run container in background and do not await or deliver its results.

---

**Note:** This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

---

**failhard** [True] If True, the state will return a False result if the exit code of the container is non-zero. When this argument is set to False, the state will return a True result regardless of the container's exit code.

---

**Note:** This has no effect if `bg` is set to `True`.

---

**replace** [False] If `True`, and if the named container already exists, this will remove the existing container. The default behavior is to return a `False` result when the container already exists.

**force** [False] If `True`, and the named container already exists, *and* `replace` is also set to `True`, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪sh
```

#### USAGE EXAMPLE

```
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
build_package:
 docker_container.run:
 - image: myuser/builder:latest
 - binds: /home/myuser/builds:/build_dir
 - command: /scripts/build.sh {{ pkg_version }}
 - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
 - replace: True
 - networks:
 - mynet
 - require:
 - docker_network: mynet
```

```
salt.states.docker_container.running(name, image=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, force=False, watch_action='force', start=True, shutdown_timeout=None, client_timeout=60, networks=None, **kwargs)
```

Ensure that a container with a specific configuration is present and running

**name** Name of the container

**image** Image to use for the container

---

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

---

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker_pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

**skip\_translate** This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```
mycontainer:
 docker_container.running:
 - image: 7.3.1611
 - port_bindings:
 - 10.2.9.10:8080:80
```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```
mycontainer:
 docker_container.running:
 - image: 7.3.1611
 - skip_translate: port_bindings
 - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}
```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

**ignore\_collisions** [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

**force** [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

**watch\_action** [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
 docker_container.running:
 - image: busybox
 - watch_action: SIGHUP
 - watch:
 - file: some_file
```

---

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

**start** [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the `Django migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

**shutdown\_timeout** If the container needs to be replaced, the container will be stopped using `docker.stop`. If a `shutdown_timeout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

**client\_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

## NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the `networks` option is used, any networks (including the default `bridge` network) which are not specified will be disconnected.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` and `bridge` are being configured *without* arguments:

```
foo:
 docker_container.running:
 - image: myuser/myimage:foo
 - networks:
 - net1:
 - aliases:
 - bar
 - baz
 - ipv4_address: 10.0.20.50
 - net2
 - bridge
 - require:
 - docker_network: net1
 - docker_network: net2
```

The supported arguments are the ones from the `docker-py`'s `connect_container_to_network` function (other than `container` and `net_id`).

---

**Important:** Unlike with the arguments described in the **CONTAINER CONFIGURATION PARAMETERS** section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

---

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```
foo:
 docker_container.running:
 - image: myuser/myimage:foo
 - networks: []
```

## CONTAINER CONFIGURATION PARAMETERS

**auto\_remove** (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a `docker` container with `--rm` on the CLI).

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - auto_remove: True
```

- binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:
- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
  - `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
  - `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
  - `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

---

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

---

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds:
 - /srv/www:/var/www:ro
 - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both `ro/rw` and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds:
 - /srv/www:/var/www:ro,Z
 - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
 docker_container.running:
```

(continues on next page)

(continued from previous page)

```

- image: bar/baz:latest
- binds:
 - /srv/www:/var/www:ro,Z
 - /home/myuser/conf/foo.conf:/etc/foo.conf:Z

```

**blkio\_weight** Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - blkio_weight: 100

```

**blkio\_weight\_device** Block IO weight (relative device weight), specified as a list of expressions in the format PATH:RATE

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - blkio_weight_device: /dev/sda:100

```

**cap\_add** List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_add: SYS_ADMIN,MKNOD

```

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_add:
 - SYS_ADMIN
 - MKNOD

```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**cap\_drop** List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_drop: SYS_ADMIN,MKNOD

```

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_drop:
 - SYS_ADMIN
 - MKNOD

```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**command (or *cmd*)** Command to run in the container

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - command: bash
```

**cpuset\_cpus** (or *cpuset*) CPUs on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpuset_cpus: "0,1"
```

**cpuset\_mems** Memory nodes on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpuset_mems: "0,1"
```

**cpu\_group** The length of a CPU period in microseconds

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_group: 100000
```

**cpu\_period** Microseconds of CPU time that the container can get in a CPU period

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_period: 50000
```

**cpu\_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_shares: 512
```

**detach** [False] If True, run the container's command in the background (daemon mode)

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - detach: True
```

**devices** List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
```

(continues on next page)

(continued from previous page)

- ```

- devices:
  - /dev/net/tun
  - /dev/xvda1:/dev/xvda1
  - /dev/xvdb1:/dev/xvdb1:r

```

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb

```

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500

```

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb

```

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

dns List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

dns_search List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
```

(continues on next page)

(continued from previous page)

```
- foo1.domain.tld
- foo2.domain.tld
```

domainname The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

entrypoint Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

extra_hosts Additional hosts to add to the container's `/etc/hosts` file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

Note: This option requires Docker 1.3.0 or newer.

group_add List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

hostname Hostname of the container. If not provided, the value passed as the container's "name" will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

Warning: `hostname` cannot be set if `network_mode` is set to `host`. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

interactive (or `stdin_open`) [False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

ipc_mode (or `ipc`) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues

- `host`: use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

Warning: Using `host` gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

Note: The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

labels Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
      foo: ''
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

links Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

log_driver and **log_opt** Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The **log_opt** can also be expressed as a comma-separated or YAML list of **key=value** pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

lxc_conf Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format **VARNAME=value**. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker, lxc.arch=x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64
```

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M
```

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60
```

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G
```

network_disabled [False] If True, networking will be disabled within the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
```

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `docker.network_present`.

Warning: Using `host` mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1
```

oom_kill_disable Whether to disable OOM killer

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False
```

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500
```

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host
```

Note: This option requires Docker 1.5.0 or newer.

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

port_bindings (or *publish*) Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
      - 4505-4506:14505-14506
      - 2123:2123/udp
      - 8080
```

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

privileged [False] If True, runs the exec process with extended privileges

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True
```

publish_all_ports (or *publish_all*) [False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

`read_only` [False] If True, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

`restart_policy` (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

`security_opt` (or *security_opts*): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

`shm_size` Size of /dev/shm

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

`stop_signal` Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

stop_timeout Timeout to stop the container, in seconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refer's to the container's configured stop timeout.

storage_opt Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

sysctls (or *sysctl*) Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

tmpfs A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

tty [False] Attach TTYs

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

ulimits List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

user User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

usersns_mode (or *user_ns_mode*) Sets the user namespace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - usersns_mode: host
```

volumes (or *volume*) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
- image: bar/baz:latest
- volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

volumes_from Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

volume_driver sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

working_dir (or *workdir*) Working directory inside the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

`salt.states.docker_container.stopped` (*name=None*, *containers=None*, *shutdown_timeout=None*, *unpause=False*, *error_on_absent=True*, ***kwargs*)

Ensure that a container (or containers) is stopped

name Name or ID of the container

containers Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker_container.stopped:
    - containers:
```

(continues on next page)

(continued from previous page)

```
- foo
- bar
- baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

shutdown_timeout Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container's configured `stop_timeout` will be observed. If `stop_timeout` was also unset on the container, then a timeout of 10 seconds will be used.

unpause [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

error_on_absent [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

21.19.71 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

depends `docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` \geq 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

Note: To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_image.absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

images Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```

remove_images:
  docker_image.absent:
    - images:
      - busybox
      - centos:6
      - nginx

```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

force [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.mod_watch`(*name*, *sfun=None*, ***kwargs*)

The `docker_image` watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_image.present`(*name*, *tag=None*, *build=None*, *load=None*, *force=False*, *insecure_registry=False*, *client_timeout=60*, *dockerfile=None*, *sls=None*, *base='opensuse/python'*, *saltenv='base'*, *pillarenv=None*, *pillar=None*, ***kwargs*)

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```

myuser/myimage:
  docker_image.present:
    - tag: mytag

```

tag Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

build Path to directory on the Minion containing a Dockerfile

```

myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag

myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag
    - dockerfile: Dockerfile.alternative

```

The image will be built using *docker.build* and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

load Loads a tar archive created with *docker.load* (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```

myuser/myimage:
  docker_image.present:
    - load: salt://path/to/image.tar
    - tag: mytag

```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

force [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

sls Allow for building of image with *docker.sls_build* by specifying the SLS files with which to build. This can be a list or comma-separated string.

```

myuser/myimage:
  docker_image.present:
    - tag: latest
    - sls:
      - webapp1
      - webapp2
    - base: centos
    - saltenv: base

```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

base Base image with which to start *docker.sls_build*

New in version 2017.7.0.

saltenv Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

21.19.72 salt.states.docker_network

Management of Docker networks

New in version 2017.7.0.

depends `docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` $\geq 1.6.0$ are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_network.absent`(*name*)

Ensure that a network is absent.

name Name of the network

Usage Example:

```
network_foo:
  docker_network.absent
```

`salt.states.docker_network.present`(*name*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *containers=None*, *reconnect=True*, ***kwargs*)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present

Note: This state supports all arguments for network and IPAM pool configuration which are available for the release of `docker-py` installed on the minion. For that reason, the arguments described below in the [NETWORK CONFIGURATION](#) and [IP ADDRESS MANAGEMENT \(IPAM\)](#) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of `docker-py` (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

name Network name

skip_translate This function translates Salt SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

New in version 2018.3.0.

ignore_collisions [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

validate_ip_addrs [True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

containers A list of containers which should be connected to this network.

Note: As of the 2018.3.0 release, this is not the recommended way of managing a container's membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container's IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that the `docker_network.present` state ends up being run *before* the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use *docker_container.running's network management support*.

reconnect [True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when *managing static IPs in docker_container.running*. For instance, if a network's subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network *again* and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

NETWORK CONFIGURATION ARGUMENTS

driver Network driver

```
mynet:
  docker_network.present:
    - driver: macvlan
```

driver_opts (or *driver_opt*, or *options*) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts: macvlan_mode=bridge,parent=eth0
```

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode=bridge
      - parent=eth0
```

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode: bridge
      - parent: eth0
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      macvlan_mode: bridge
      parent: eth0
```

check_duplicate [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```
mynet:
  docker_network.present:
    - check_duplicate: False
```

internal [False] If True, restricts external access to the network

```
mynet:
  docker_network.present:
    - internal: True
```

labels Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```

mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world

```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

foo:
  docker_network.present:
    - labels:
      foo: ''
      bar: baz
      hello: world

```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

enable_ipv6 (or *ipv6*) [False] Enable IPv6 on the network

```

mynet:
  docker_network.present:
    - enable_ipv6: True

```

Note: While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](#) for information on how to do this.

attachable [False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```

mynet:
  docker_network.present:
    - attachable: True

```

Note: This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

scope Specify the network's scope (`local`, `global` or `swarm`)

```

mynet:
  docker_network.present:
    - scope: local

```

ingress [False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

```

mynet:
  docker_network.present:
    - ingress: True

```

IP ADDRESS MANAGEMENT (IPAM)

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the *IPAM pool arguments* below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument (click [here](#) for some examples). [These docs](#) also have more information on these arguments.

IPAM ARGUMENTS

`ipam_driver` IPAM driver to use, if different from the default one

```
mynet:
  docker_network.present:
    - ipam_driver: foo
```

`ipam_opts` Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts: foo=bar,baz=qux
```

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo=bar
      - baz=qux
```

```
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo: bar
      - baz: qux
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
  docker_network.present:
    - ipam_driver: macvlan
    - ipam_opts:
      foo: bar
      baz: qux
```

IPAM POOL ARGUMENTS

`subnet` Subnet in CIDR format that represents a network segment

`iprange` (or *`ip_range`*) Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

`gateway` IPv4 or IPv6 gateway for the master subnet

`aux_addresses` (or *`aux_address`*) A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

IPAM CONFIGURATION EXAMPLES

Below is an example of an IPv4-only network (keep in mind that `subnet` is the only required argument).

```

mynet:
  docker_network.present:
    - subnet: 10.0.20.0/24
    - iprange: 10.0.20.128/25
    - gateway: 10.0.20.254
    - aux_addresses:
      - foo.bar.tld: 10.0.20.50
      - hello.world.tld: 10.0.20.51

```

Note: The `aux_addresses` can be passed differently, in the same way that `driver_opts` and `ipam_opts` can.

This same network could also be configured this way:

```

mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        iprange: 10.0.20.128/25
        gateway: 10.0.20.254
      - aux_addresses:
        foo.bar.tld: 10.0.20.50
        hello.world.tld: 10.0.20.51

```

Here is an example of a mixed IPv4/IPv6 subnet.

```

mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        gateway: 10.0.20.1
      - subnet: fe3f:2180:26:1::/123
        gateway: fe3f:2180:26:1::1

```

21.19.73 salt.states.docker_volume

Management of Docker volumes

New in version 2017.7.0.

depends `docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` $\geq 1.6.0$ are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_volume.absent` (*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from `docker.volume_absent` to `docker_volume.absent`
name Name of the volume

Usage Examples:

```
volume_foo:  
  docker_volume.absent
```

`salt.states.docker_volume.present` (*name*, *driver=None*, *driver_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from `docker.volume_present` to `docker_volume.present`
name Name of the volume

driver Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

driver_opts Options for the volume driver

force [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:  
  docker_volume.present
```

```
volume_bar:  
  docker_volume.present  
  - name: bar  
  - driver: local  
  - driver_opts:  
    foo: bar
```

```
volume_bar:  
  docker_volume.present  
  - name: bar  
  - driver: local  
  - driver_opts:  
    - foo: bar  
    - option: value
```

21.19.74 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```

damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs

```

Ensure the user damian does not exist

```

damian:
  drac.absent:
    - name: damian

```

Ensure DRAC network is in a consistent state

```

my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1

```

`salt.states.drac.absent`(*name*)

Ensure a user does not exist on the Dell DRAC
name: The users username

`salt.states.drac.network`(*ip, netmask, gateway*)

Ensure the DRAC network settings are consistent

`salt.states.drac.present`(*name, password, permission*)

Ensure the user exists on the Dell DRAC
name: The users username
password The password used to authenticate
permission The permissions that should be assigned to a user

21.19.75 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

`salt.states.elasticsearch.alias_absent`(*name, index*)

Ensure that the index alias is absent.
name Name of the index alias to remove
index Name of the index for the alias

`salt.states.elasticsearch.alias_present`(*name, index, definition=None*)

Ensure that the named index alias is present.
name Name of the alias
index Name of the index
definition Optional dict for filters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

Example:

```

mytestalias:
  elasticsearch.alias_present:
    - index: testindex

```

(continues on next page)

(continued from previous page)

```
- definition:
  filter:
    term:
      user: kimchy
```

`salt.states.elasticsearch.index_absent`(*name*)

Ensure that the named index is absent.

name Name of the index to remove

`salt.states.elasticsearch.index_present`(*name*, *definition=None*)

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
      settings:
        index:
          number_of_shards: 10
```

`salt.states.elasticsearch.index_template_absent`(*name*)

Ensure that the named index template is absent.

name Name of the index to remove

`salt.states.elasticsearch.index_template_present`(*name*, *definition*, *check_definition=False*)

Ensure that the named index template is present.

name Name of the index to add

definition Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

check_definition If the template already exists and the definition is up to date

Example:

```
mytestindex2_template:
  elasticsearch_index_template_present:
    - definition:
      template: logstash-*
      order: 1
      settings:
        number_of_shards: 1
```

`salt.states.elasticsearch.pipeline_absent`(*name*)

Ensure that the named pipeline is absent

name Name of the pipeline to remove

`salt.states.elasticsearch.pipeline_present`(*name*, *definition*)

Ensure that the named pipeline is present.

name Name of the index to add

definition Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

Example:

```
test_pipeline:
  elasticsearch.pipeline_present:
    - definition:
      description: example pipeline
      processors:
        - set:
          field: collector_timestamp_millis
          value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'
```

`salt.states.elasticsearch.search_template_absent(name)`

Ensure that the search template is absent

name Name of the search template to remove

`salt.states.elasticsearch.search_template_present(name, definition)`

Ensure that the named search template is present.

name Name of the search template to add

definition Required dict for creation parameters as per <http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html>

Example:

```
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
      inline:
      size: 10
```

21.19.76 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index.absent(name)`

Ensure that the named index is absent.

name Name of the index to remove

`salt.states.elasticsearch_index.present(name, definition=None)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as optional.

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present
```

(continues on next page)

```
# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
      settings:
        index:
          number_of_shards: 10
```

21.19.77 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index_template.absent(name)`

Ensure that the named index template is absent.

name Name of the index to remove

`salt.states.elasticsearch_index_template.present(name, definition)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as required.

Ensure that the named index template is present.

name Name of the index to add

definition Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

Example:

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
      template: logstash-*
      order: 1
      settings:
        number_of_shards: 1
```

21.19.78 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.setenv(name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False)`

Set the salt process environment variables.

name The environment key to set. Must be a string.

value Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored.

Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
  environ.setenv:
    - name: foo
    - value: bar
    - update_minion: True

a_dict_env:
  environ.setenv:
    - name: does_not_matter
    - value:
      foo: bar
      baz: quux
```

21.19.79 salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

`salt.states.eselect.set_` (*name, target, module_parameter=None, action_parameter=None*)

Verify that the given module is set to the given target

name The name of the module

target The target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

```
profile:
  eselect.set:
    - target: hardened/linux/amd64
```

21.19.80 salt.states.etcd_mod

Manage etcd Keys

New in version 2015.8.0.

depends

- python-etcd

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Etd profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`.

```
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass
```

Available Functions

- `set`

This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- `wait_set`

Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
etcd.rm:
  - profile: my_etcd_config
```

- `wait_rm`

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
file.managed:
  - source: salt://file.txt

/foo/bar/baz:
etcd.wait_rm:
  - profile: my_etcd_config
  - watch:
    - file: /some/file.txt
```

`salt.states.etcd_mod.directory`(*name*, *profile=None*, ***kwargs*)

Create a directory in etcd.

name The etcd directory name, for example: `/foo/bar/baz`.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
etcd.host: 127.0.0.1
etcd.port: 4001
```

`salt.states.etcd_mod.mod_watch`(*name*, ***kwargs*)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

Note: This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.etcd_mod.rm`(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to `False`. If `True` performs a recursive delete.

profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
etcd.host: 127.0.0.1
etcd.port: 4001
```

`salt.states.etcd_mod.set_`(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile Optional, defaults to None. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.wait_rm`(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

name The etcd key name to remove, for example `/foo/bar/baz`.

recurse Optional, defaults to False. If True performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

profile Optional, defaults to None. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.wait_set`(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

name The etcd key name, for example: `/foo/bar/baz`.

value The value the key should contain.

profile The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

21.19.81 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
```

(continues on next page)

(continued from previous page)

```

ethtool.offload:
- name: eth0
- tcp_segmentation_offload: on

```

`salt.states.ethtool.coalesce`(*name*, ***kwargs*)

Manage coalescing settings of network device

name Interface name to apply coalescing settings

```

eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
    - rx_frames_high: 0
    - tx_usecs_high: 0
    - tx_frames_high: 0
    - sample_interval: 0

```

`salt.states.ethtool.offload`(*name*, ***kwargs*)

Manage protocol offload and other features of network device

name Interface name to apply coalescing settings

```

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on

```

`salt.states.ethtool.ring`(*name*, ***kwargs*)

Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

name Interface name to apply ring parameters

```

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max

```

21.19.82 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
                                     dump_port=6500)
```

Ensures a host's core dump configuration.

name Name of the state.

enabled Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

dump_ip The IP address of host that will accept the dump.

host_vnic Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

```
salt.states.esxi.diskgroups_configured(name, diskgroups, erase_disks=False)
```

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises an error if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn't exist
3. Adds extra capacity disks to the existing diskgroup

Example:

```
{
  'cache_scsi_addr': 'vmhba1:C0:T0:L0',
  'capacity_scsi_addrs': [
    'vmhba2:C0:T0:L0',
    'vmhba3:C0:T0:L0',
    'vmhba4:C0:T0:L0',
  ]
}
```

name Mandatory state name

diskgroups Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

erase_disks Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

```
salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%',
                                       dedicated_backing_disk=False,
                                       erase_backing_disk=False)
```

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn't exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is True and partitions already exist on the backing disk
4. Configures `host_cache` to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

Examples

Percentage swap size (can't be 100%)

```
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
    'vmfs_version': 5,
    'name': 'hostcache'
  }
  'dedicated_backing_disk': false
  'swap_size': '98%',
}
```

Fixed sized swap size

```
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
    'vmfs_version': 5,
    'name': 'hostcache'
  }
  'dedicated_backing_disk': true
  'swap_size': '10GiB',
}
```

name Mandatory state name.

enabled Specifies whether the host cache is enabled.

datastore Specifies the host cache datastore.

swap_size Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.

dedicated_backing_disk Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is False

erase_backing_disk Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

```
salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None,
                                service_restart=False, update_datetime=False)
```

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

name Name of the state.

service_running Ensures the running state of the ntp daemon for the host. Boolean value where `True` indicates that ntpd should be running and `False` indicates that it should be stopped.

ntp_servers A list of servers that should be added to the ESXi host's NTP configuration.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the ntp daemon will be restarted, regardless of its previous running state. Default is `False`.

update_datetime If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```

`salt.states.esxi.password_present` (*name, password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

name Name of the state.

password The new password to change on the host.

Example:

```
configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'
```

`salt.states.esxi.ssh_configured` (*name, service_running, ssh_key=None, ssh_key_file=None, service_policy=None, service_restart=False, certificate_verify=False*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

name Name of the state.

service_running Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

ssh_key Public SSH key to added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

ssh_key_file File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

certificate_verify If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```

configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True

```

`salt.states.esxi.syslog_configured`(*name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

name Name of the state.

syslog_configs Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (-))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

reset_syslog_config Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

reset_configs A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```

configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
      loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
      default-timeout: 120
    - firewall: True

```

(continues on next page)

(continued from previous page)

```

- reset_service: True
- reset_syslog_config: True
- reset_configs: loghost,default-timeout

```

`salt.states.esxi.vmotion_configured`(*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

name Name of the state.

enabled Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

device The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```

configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device

```

`salt.states.esxi.vsan_configured`(*name, enabled, add_disks_to_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

name Name of the state.

enabled Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

add_disks_to_vsan If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```

configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True

```

21.19.83 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send`(*name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

Parameters **show_changed** – If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```

# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:

```

(continues on next page)

(continued from previous page)

```

- data:
  status: "Half-way through the state run!"

# ...snip bunch of states below

```

`salt.states.event.wait` (*name*, *sfun=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```

# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
        - pkg: apache

```

21.19.84 salt.states.file

Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```

/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - attrs: ai
    - template: jinja
    - defaults:
        custom_var: "default value"
        other_var: 123
{% if grains['os'] == 'Ubuntu' %}

```

(continues on next page)

(continued from previous page)

```

- context:
  custom_var: "override"
{% endif %}

```

It is also possible to use the `py_renderer` as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```

def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context]) # Arguments as globals
    return '\n\n'.join(lines)

```

Note: The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. [More information.](#)

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be `override`, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```

/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - attrs: i
    - backup: minion

```

Note: Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the [backup_mode documentation](#).

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```

/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
    - user: foo
    - group: users
    - mode: '0644'
    - attrs: i

```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
  file.managed:
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

Note: There is more documentation about this feature in the *Names declaration* section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
```

(continues on next page)

(continued from previous page)

- **group:** named
- **mode:** 660

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
- recurse:
  - user
  - group
  - mode
```

As a default, mode will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- file_mode: 744
- dir_mode: 755
- makedirs: True
- recurse:
  - user
  - group
  - mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:
file.symlink:
- target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
file.recurse:
- source: salt://code/flask
- include_empty: True
```

A more complex recurse example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
      most_recent: 5
      first_of_hour: 4
      first_of_day: 14
      first_of_week: 6
      first_of_month: 6
      first_of_year: all
```

`salt.states.file.absent`(*name*, ***kwargs*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

name The path which should be deleted

`salt.states.file.accumulated`(*name*, *filename*, *text*, ***kwargs*)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

name Accumulator name

filename Filename which would receive this accumulator (see file.managed state documentation about *name*)

text String or list for adding in accumulator

require_in / watch_in One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
```

(continues on next page)

(continued from previous page)

```
- source: salt://animal_file.txt
- template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↪animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

Note: The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

```
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, tem-
                        plate='jinja', sources=None, source_hashes=None, defaults=None, con-
                        text=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file. Defaults to `False`.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type | Length |
|--------|--------|
| sha512 | 128 |
| sha384 | 96 |
| sha256 | 64 |
| sha224 | 56 |
| sha1 | 40 |
| md5 | 32 |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

source_hashes A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.append:
- text:
  - Trust no one unless you have eaten much salt with him.
  - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
file:
- append
- template: jinja
- sources:
  - salt://motd/devops-messages.tpl
  - salt://motd/hr-messages.tpl
  - salt://motd/general-messages.tpl
```

New in version 0.9.5.

`salt.states.file.blockreplace` (*name*, *marker_start*='#- start managed zone -', *marker_end*='#- end managed zone -', *source*=None, *source_hash*=None, *template*='jinja', *sources*=None, *source_hashes*=None, *defaults*=None, *context*=None, *content*="", *append_if_not_found*=False, *prepend_if_not_found*=False, *backup*='.bak', *show_changes*=True, *append_newline*=None)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use `file.accumulated` and target this state. All accumulated data dictionaries' content will be added in the content block.

name Filesystem path to the file to be edited

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content The content to be used between the two lines identified by `marker_start` and `marker_end`

source The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
  file.blockreplace:
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type | Length |
|--------|--------|
| ===== | ===== |
| sha512 | 128 |
| sha384 | 96 |

(continues on next page)

(continued from previous page)

| | |
|--------|----|
| sha256 | 64 |
| sha224 | 56 |
| sha1 | 40 |
| md5 | 32 |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

template [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

context Overrides default context variables passed to the template

defaults Default context passed to the template

append_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be appended to the file.

prepend_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be prepended to the file.

backup The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

dry_run [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.

show_changes [True] Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If `False`, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

append_newline Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

(continues on next page)

(continued from previous page)

```
hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
        text 3
        text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

`salt.states.file.cached`(*name*, *source_hash*="", *source_hash_name*=None, *skip_verify*=False, *saltenv*='base')

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the `saltenv` in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

source_hash See the documentation for this same argument in the *file.managed* state.

Note: For remote files not originating from the `salt://` fileserver, such as `http(s)` or `ftp` servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

source_hash_name See the documentation for this same argument in the *file.managed* state.

skip_verify See the documentation for this same argument in the *file.managed* state.

Note: Setting this to `True` will result in a copy of the file being downloaded from a remote (`http(s)`, `ftp`, etc.) source each time the state is run.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the `cachedir`. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                  source_hash=source_hash,
```

(continues on next page)

(continued from previous page)

```
source_hash_name=source_hash_name,
skip_verify=skip_verify,
saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a `try/except`.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

`salt.states.file.comment` (*name*, *regex*, *char*='#', *backup*='.bak')

Comment out specified lines in a file.

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you need the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

char [#] The character to be inserted at the beginning of a line in order to comment it out

backup [.bak] The file will be backed up before edit with this file extension

Warning: This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/fstab:
file.comment:
- regex: ^bind 127.0.0.1
```

New in version 0.9.5.

`salt.states.file.copy_` (*name*, *source*, *force*=`False`, *makedirs*=`False`, *preserve*=`False`, *user*=`None`, *group*=`None`, *mode*=`None`, *subdir*=`False`, ***kwargs*)

If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the `force` option is set to `True`.

Note: This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a `file.managed` state.

name The location of the file to copy to

source The location of the file to copy to the location specified with `name`

force If the target location is present then the file will not be moved, specify `"force: True"` to overwrite the target file

makedirs If the target subdirectories don't exist create them

preserve New in version 2015.5.0.

Set `preserve`: True to preserve user/group ownership and mode after copying. Default is False. If `preserve` is set to True, then user/group/mode attributes will be ignored.

user New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to True, then this will be ignored

group New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to True or on Windows this will be ignored

mode New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to True, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

subdir New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

```
salt.states.file.decode(name, encoded_data=None, contents_pillar=None, encoding_type='base64',
                        checksum='md5')
```

Decode an encoded file and write it to disk

New in version 2016.3.0.

name Path of the file to be written.

encoded_data The encoded file. Either this option or `contents_pillar` must be specified.

contents_pillar A Pillar path to the encoded file. Uses the same path syntax as `pillar.get`. The `hashutil.base64_encodefile` function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

encoding_type [base64] The type of encoding.

checksum [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      {{ salt.pillar.get('path:to:data') | indent(8) }}

```

`salt.states.file.directory`(*name*, *user=None*, *group=None*, *recurse=None*, *max_depth=None*, *dir_mode=None*, *file_mode=None*, *makedirs=False*, *clean=False*, *require=None*, *exclude_pat=None*, *follow_symlinks=False*, *force=False*, *backupname=None*, *allow_symlink=True*, *children_only=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, *win_perms_reset=False*, ***kwargs*)

Ensure that a named directory is present and has the right perms

name The location to create or manage a directory, as an absolute path

user The user to own the directory; this defaults to the user salt is running as on the minion

group The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

recurse Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If *mode* is defined, will recurse on both *file_mode* and *dir_mode* if they are defined. If *ignore_files* or *ignore_dirs* is included, files or directories will be left unchanged respectively. Example:

```

/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode

```

Leave files or directories unchanged:

```

/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs

```

New in version 2015.5.0.

max_depth Limit the recursion depth. The default is no limit=*None*. 'max_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

dir_mode / **mode** The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

file_mode The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to `dir_mode`. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

makedirs If the directory is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max_depth' are mutually exclusive.

require Require other resources such as packages or files

exclude_pat When 'clean' is set to `True`, exclude this pattern from removal list and preserve in the destination.

follow_symlinks [`False`] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

force If the name of the directory exists and is not a directory and `force` is set to `False`, the state will fail. If `force` is set to `True`, the file in the way of the directory will be deleted to make room for the directory, unless `backupname` is set, then it will be renamed.

New in version 2014.7.0.

backupname If the name of the directory exists and is not a directory, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first.

New in version 2014.7.0.

allow_symlink [`True`] If `allow_symlink` is `True` and the specified path is a symlink, it will be allowed to remain if it points to a directory. If `allow_symlink` is `False` then the state will fail, unless `force` is also set to `True`, in which case it will be removed or renamed, depending on the value of the `backupname` argument.

New in version 2014.7.0.

children_only [`False`] If `children_only` is `True` the base of a path is excluded when performing a recursive operation. In case of `/path/to/base`, `base` will be ignored while all of `/path/to/base/*` are still operated on.

win_owner [`None`] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [`None`] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` is optional and defaults to `this_folder_subfolder_files`.

New in version 2017.7.0.

win_deny_perms [`None`] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

win_inheritance [`True`] `True` to inherit permissions from the parent directory, `False` not to inherit permission.

New in version 2017.7.0.

win_perms_reset [`False`] If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```

create_config_dir:
  file.directory:
    - name: 'C:\config\'
    - win_owner: Administrators
    - win_perms:
      # Basic Permissions
      dev_ops:
        perms: full_control
      # List of advanced permissions
      appuser:
        perms:
          - read_attributes
          - read_ea
          - create_folders
          - read_permissions
        applies_to: this_folder_only
      joe_snuffy:
        perms: read
        applies_to: this_folder_files
    - win_deny_perms:
      fred_snuffy:
        perms: full_control
    - win_inheritance: False

```

`salt.states.file.exists`(*name*, ***kwargs*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn't exist, it will return an error.

name Absolute path which must exist

`salt.states.file.line`(*name*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*, *create=False*, *user=None*, *group=None*, *file_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

Parameters

- **name** – Filesystem path to the file to be edited.
- **content** – Content of the line. Allowed to be empty if `mode=delete`.
- **match** – Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` becomes the content value.

- **mode** – Defines how to edit a line. One of the following options is required:
 - **ensure** If line does not exist, it will be added.
 - **replace** If line already exists, it will be replaced.
 - **delete** Delete the line, once found.
 - **insert** Insert a line.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

- **location** – Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over

both the `before` and `after` kwargs. Valid locations are:

- `start` Place the content at the beginning of the file.
- `end` Place the content at the end of the file.
- **before** – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- **after** – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- **show_changes** – Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

- **backup** – Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".
- **quiet** – Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- **indent** – Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.
- **create** – Create an empty file if doesn't exists.

New in version 2016.11.0.

- **user** – The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

- **group** – The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.

New in version 2016.11.0.

- **file_mode** – The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

```
salt.states.file.managed(name, source=None, source_hash="", source_hash_name=None,
                        keep_source=True, user=None, group=None, mode=None, attrs=None,
                        template=None, makedirs=False, dir_mode=None, context=None, re-
                        place=True, defaults=None, backup="", show_changes=True, create=True,
                        contents=None, tmp_dir="", tmp_ext="", contents_pillar=None, con-
                        tents_grains=None, contents_newline=True, contents_delimiter=';',
                        encoding=None, encoding_errors='strict', allow_empty=True,
                        follow_symlinks=True, check_cmd=None, skip_verify=False,
                        win_owner=None, win_perms=None, win_deny_perms=None,
                        win_inheritance=True, win_perms_reset=False, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run

through a templating system.

name The location of the file to manage, as an absolute path.

source The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type | Length |
|--------|--------|
| sha512 | 128 |
| sha384 | 96 |
| sha256 | 64 |
| sha224 | 56 |
| sha1 | 40 |
| md5 | 32 |

Using a Source Hash File The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the `source_hash` argument needs to be a url, the standard download urls are supported, `ftp`, `http`, `salt` etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      ↪tomdroid-src-0.7.3.tar.gz
```

(continues on next page)

(continued from previous page)

```
- source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↳etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

Inserting the Source Hash in the SLS Data

The `source_hash` can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
↳src-0.7.3.tar.gz
- source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

Note: Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
↳src-0.7.3.tar.gz
- source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

Known issues: If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳tomdroid-src-0.7.3.tar.gz
- source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳tomdroid-src-0.7.3.tar.gz/+md5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:  
file.managed:  
- source: https://mydomain.tld/dir2/foo.txt  
- source_hash: https://mydomain.tld/ashes  
- source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

Note: `keep` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

attrs The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aACcDeijPsStTu`.

Note: This option is **not** supported on Windows.

New in version 2018.3.0.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`

- *mako*
- *py*
- *wempy*

makedirs [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

backup Overrides the default backup mode for this specific file. See [backup_mode documentation](#) for more details.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create [True] If set to `False`, then the file will only be managed if the file already exists on the system.

contents Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
      This is line 1
      This is line 2
```

contents_pillar New in version 0.17.0.

Changed in version 2016.11.0: `contents_pillar` can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in [pillar.get](#). This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - attrs: a
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```

userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      MIIEowIBAAKCAQEAAoQiwO3JhBquPAalQF9qP1LLZNXVjYMIswrMe2HcWUVBgh+vY
      U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGL1vgA0bJAnMT623dMXjVKwnEagZPRJixDy
      B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0pqxu+UyFbAGLin+
      GpxzZAMaFpZw4sSbILRuissXZj/sHpQb8p9M5Ie04Z3rjkCP1cxI
      -----END RSA PRIVATE KEY-----

```

Note: The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *file_tree external pillar* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

contents_grains New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in *grains.get*. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```

write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd

```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```

salt '*' grains.set motd 'Welcome! This system is managed by Salt.'

```

contents_newline [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If True, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to False will omit this final newline.

contents_delimiter New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to *pillar.get* or *grains.get* when retrieving the contents.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

encoding_errors ['strict'] Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

allow_empty [True] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
file.managed:
- user: root
- group: root
- mode: 0440
- attrs: i
- source: salt://sudoers/files/sudoers.jinja
- template: jinja
- check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

tmp_dir Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
file.managed:
- user: root
- group: root
- mode: 0755
- tmp_dir: '/etc/dhcp'
- contents: "# Managed by Salt"
- check_cmd: dhcpd -t -cf
```

tmp_ext Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` upstart config checker).

```
/etc/init/test.conf:
file.managed:
- user: root
- group: root
- mode: 0440
- tmp_ext: '.conf'
- contents:
- 'description "Salt Minion"'
- 'start on started mountall'
- 'stop on shutdown'
- 'respawn'
- 'exec salt-minion'
- check_cmd: init-checkconf -f
```

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```
create_config_file:
  file.managed:
    - name: C:\config\settings.cfg
    - source: salt://settings.cfg
    - win_owner: Administrators
    - win_perms:
      # Basic Permissions
      dev_ops:
        perms: full_control
      # List of advanced permissions
      appuser:
        perms:
          - read_attributes
          - read_ea
          - create_folders
          - read_permissions
      joe_snuffy:
        perms: read
    - win_deny_perms:
      fred_snuffy:
        perms: full_control
    - win_inheritance: False
```

`salt.states.file.missing(name, **kwargs)`

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

name Absolute path which must NOT exist

`salt.states.file.mknod(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')`

Create a special file similar to the 'nix `mknod` command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix `mknod`. It is also important to note that not just anyone can create

special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

name name of the file

ntype node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)

major major number of the device does not apply to a fifo pipe

minor minor number of the device does not apply to a fifo pipe

user owning user of the device/pipe

group owning group of the device/pipe

mode permissions on the device/pipe

Usage:

```

/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660

```

New in version 0.17.0.

`salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)`

Execute the check_cmd logic.

Return a result dict if check_cmd succeeds (check_cmd == 0) otherwise return True

`salt.states.file.not_cached(name, saltenv='base')`

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf? saltenv=dev).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with salt:// URL).

```
salt.states.file.patch(name, source=None, source_hash=None, source_hash_name=None,
                      skip_verify=False, template=None, context=None, defaults=None, options="",
                      reject_file=None, strip=None, saltenv=None, **kwargs)
```

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The `hash` and `dry_run_first` options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the `strip` option) instead of a file.

Note: A suitable `patch` executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

name The file or directory to which the patch should be applied

source The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (`salt://`, `http://`, `https://`, `ftp://`, etc.). Templating is also now supported.

source_hash Works the same way as in *file.managed*.

New in version 2019.2.0.

source_hash_name Works the same way as in *file.managed*

New in version 2019.2.0.

skip_verify Works the same way as in *file.managed*

New in version 2019.2.0.

template Works the same way as in *file.managed*

New in version 2019.2.0.

context Works the same way as in *file.managed*

New in version 2019.2.0.

defaults Works the same way as in *file.managed*

New in version 2019.2.0.

options Extra options to pass to patch. This should not be necessary in most cases.

Note: For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

reject_file If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

Important: The parent directory must exist. Also, this will overwrite the file if it is already present.

New in version 2019.2.0.

strip Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
  file.patch:
```

(continues on next page)

(continued from previous page)

```
- source: salt://myfile.patch
- strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

saltenv Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Note: Ignored when the patch file is from a non-`salt://` source.

Usage:

```
# Equivalent to ``patch --forward /opt/myfile.txt myfile.patch``
/opt/myfile.txt:
file.patch:
- source: salt://myfile.patch
```

salt.states.file.prepend(*name*, *text=None*, *makedirs=False*, *source=None*, *source_hash=None*, *template='jinja'*, *sources=None*, *source_hashes=None*, *defaults=None*, *context=None*, *header=None*)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file. Defaults to `False`.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type | Length |
|--------|--------|
| ===== | ===== |
| sha512 | 128 |
| sha384 | 96 |
| sha256 | 64 |
| sha224 | 56 |
| sha1 | 40 |
| md5 | 32 |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

source_hashes A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.prepend:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.prepend:
- text:
  - Trust no one unless you have eaten much salt with him.
  - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
file.prepend:
- header: True
- text:
  - This will be the very first line in the file.
  - The 2nd line, regardless of duplicates elsewhere in the file.
  - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
file:
- prepend
- template: jinja
- sources:
  - salt://motd/devops-messages.tpl
  - salt://motd/hr-messages.tpl
  - salt://motd/general-messages.tpl
```

New in version 2014.7.0.

```
salt.states.file.recurse(name, source, keep_source=True, clean=False, require=None, user=None,
                        group=None, dir_mode=None, file_mode=None, sym_mode=None,
                        template=None, context=None, replace=True, defaults=None,
                        include_empty=False, backup="", include_pat=None, exclude_pat=None,
                        maxdepth=None, keep_symlinks=False, force_symlinks=False,
                        win_owner=None, win_perms=None, win_deny_perms=None,
                        win_inheritance=True, **kwargs)
```

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

name The directory to set the recursion in

source The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

require Require other resources such as packages or files

user The user to own the directory. This defaults to the user salt is running as on the minion

group The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

file_mode The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

sym_mode The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*

- *jinja*
- *mako*
- *py*
- *wempy*

Note: The template option is required when recursively applying templates.

replace [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

include_empty Set this to `True` if empty directories should also be created (default is `False`)

backup Overrides the default backup mode for all replaced files. See [backup_mode documentation](#) for more details.

include_pat When copying, include only this pattern from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

```
- include_pat: hello*           :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello         :: regexp matches 'otherhello',
                               'hello01' ...
```

exclude_pat Exclude this pattern from the source when copying. If both *include_pat* and *exclude_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on *include_pat*, and then within that result apply *exclude_pat*.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*        :: glob matches APPDATA.01,
                               APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                               or TEMPDATA for exclusion
```

maxdepth When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

```
- maxdepth: 0                 :: Only include files located in the source
                               directory
- maxdepth: 1                 :: Only include files located in the source
                               or immediate subdirectories
```

keep_symlinks Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to `rsync`, then set this to `True`.

force_symlinks Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

win_owner [None] The owner of the symlink and directories if `makedirs` is `True`. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise `False`

New in version 2017.7.7.

`salt.states.file.rename`(*name*, *source*, *force=False*, *makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

name The location of the file to rename to

source The location of the file to move to the location specified with name

force If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

makedirs If the target subdirectories don't exist create them

`salt.states.file.replace`(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *show_changes=True*, *ignore_if_missing=False*, *backslash_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

name Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `re.search()`.

Note: If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

```

{{ 'http://example.com?foo=bar%20baz' | regex_escape }}

```

repl The replacement text

count Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

flags A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE ' , 'MULTILINE ']. Optionally, `flags` may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to ['MULTILINE ']).

Note: `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to ['MULTILINE ']. When overriding the default value for `flags`, if 'MULTILINE ' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE ' to the list of flags.

bufsize How much of the file to buffer into memory at once. The default value 1 processes one line at a time.

The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found [False] If set to True, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

prepend_if_not_found [False] If set to True and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

not_found_content Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

backup The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

show_changes [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

backslash_literal [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using `append/prepend` so that the backslashes are not interpreted for the `repl` on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
      CentOS \(2.6.32[^\n]+\n\s+root[^\n]+\n\)+
```

Note: When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

`salt.states.file.retention_schedule` (*name*, *retain*, *strptime_format=None*, *timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Parameters

- **name** – The filesystem path to the directory containing backups to be managed.
- **retain** – Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
 - most_recent** `N` Keep the most recent `N` files.
 - first_of_hour** `N` For the last `N` hours from now, keep the first file after the hour.
 - first_of_day** `N` For the last `N` days from now, keep the first file after midnight. See also `timezone`.
 - first_of_week** `N` For the last `N` weeks from now, keep the first file after Sunday midnight.
 - first_of_month** `N` For the last `N` months from now, keep the first file after the start of the month.
 - first_of_year** `N` For the last `N` years from now, keep the first file after the start of the year.
- **strptime_format** – A python `strptime` format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** – The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```

/var/backups/example_directory:
  file.retention_schedule:
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 7
        first_of_week: 6    # NotImplemented yet.
        first_of_month: 6
        first_of_year: all
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - timezone: None

```

`salt.states.file.serialize`(*name*, *dataset=None*, *dataset_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=""*, *makedirs=False*, *show_changes=True*, *create=True*, *merge_if_exists=False*, *encoding=None*, *encoding_errors='strict'*, *serializer_opts=None*, *deserializer_opts=None*, ***kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

name The location of the file to create

dataset The dataset that will be serialized

dataset_pillar Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

formatter Write the data as this format. See the list of `serializer` modules for supported output formats.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

encoding_errors ['strict'] Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

user The user to own the directory, this defaults to the user salt is running as on the minion

group The group ownership set for the directory, this defaults to the group salt is running as on the minion

mode The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

backup Overrides the default backup mode for this specific file.

makedirs Create parent directories for destination file.

New in version 2014.1.3.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create Default is True, if create is set to False then the file will only be managed if the file already exists on the system.

merge_if_exists Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

serializer_opts Pass through options to serializer. For example:

```
/etc/dummy/package.yaml
file.serialize:
  - formatter: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.dump()`
- For **json**: `json.dumps()`
- For **python**: `pprint.pformat()`

deserializer_opts Like `serializer_opts` above, but only used when merging with an existing file (i.e. when `merge_if_exists` is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml
file.serialize:
  - formatter: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
  - deserializer_opts:
    - encoding: latin-1
    - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.load()`
- For **json**: `json.loads()`

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
  - dataset:
    name: naive
    description: A package using naive versioning
    author: A confused individual <iam@confused.com>
    dependencies:
      express: '>= 1.2.0'
      optimist: '>= 0.1.0'
    engine: node 0.4.1
  - formatter: json
```

will manage the file `/etc/dummy/package.json`:

```
{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
  "name": "naive"
}
```

`salt.states.file.shortcut`(*name*, *target*, *arguments=None*, *working_dir=None*, *description=None*, *icon_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, ***kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass `force: True`, if it is to be renamed, pass a `backupname`.

name The location of the shortcut to create. Must end with either `".lnk"` or `".url"`

target The location that the shortcut points to

arguments Any arguments to pass in the shortcut

working_dir Working directory in which to execute target

description Description to set on shortcut

icon_location Location of shortcut's icon

force If the name of the shortcut exists and is not a file and `force` is set to `False`, the state will fail. If `force` is set to `True`, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless `backupname` is set, when it will be renamed

backupname If the name of the shortcut exists and is not a file, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first.

makedirs If the location of the shortcut does not already have a parent directory then the state will fail, setting `makedirs` to `True` will allow Salt to create the parent directory. Setting this to `True` will also create the parent for `backupname` if necessary.

user The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds `umask` of salt process. For existing files and directories it's not enforced.

`salt.states.file.symmlink`(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=None*, ***kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass `force: True`, if it is to be renamed, pass a `backupname`.

name The location of the symlink to create

target The location that the symlink points to

force If the name of the symlink exists and is not a symlink and `force` is set to `False`, the state will fail. If `force` is set to `True`, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless `backupname` is set, when it will be renamed

backupname If the name of the symlink exists and is not a symlink, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination's parent directory.

makedirs If the location of the symlink does not already have a parent directory then the state will fail, setting **makedirs** to `True` will allow Salt to create the parent directory

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

win_owner [None] The owner of the symlink and directories if **makedirs** is `True`. If this is not passed, **user** will be used. If **user** is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise `False`

New in version 2017.7.7.

`salt.states.file.tidied`(*name*, *age=0*, *matches=None*, *rmdirs=False*, *size=0*, ***kwargs*)

Remove unwanted files based on specific criteria. Multiple criteria are OR'd together, so a file that is too large but is not old enough will still get tidied.

If neither *age* nor *size* is given all files which match a pattern in *matches* will be removed.

name The directory tree that should be tidied

age Maximum age in days after which files are considered for removal

matches List of regular expressions to restrict what gets removed. Default: `['*']`

rmdirs Whether or not it's allowed to remove directories

size Maximum allowed file size. Files greater or equal to this size are removed. Doesn't apply to directories or symbolic links

```
cleanup:
  file.tidied:
    - name: /tmp/salt_test
    - rmdirs: True
    - matches:
      - foo
      - b.*r
```

`salt.states.file.touch`(*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the 'nix "touch" command to create a new empty file or update the *atime* and *mtime* of an existing file.

Note that if you just want to create a file and don't care about *atime* or *mtime*, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

name name of the file

atime atime of the file

mtime mtime of the file

makedirs whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
  file.touch
```

New in version 0.9.5.

`salt.states.file.uncomment`(*name*, *regex*, *char*='#', *backup*='.bak')

Uncomment specified commented lines in a file

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[t]*`)

char [#] The character to remove in order to uncomment a line

backup [.bak] The file will be backed up before edit with this file extension;

Warning: This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/adduser.conf:
file.uncomment:
- regex: EXTRA_GROUPS
```

New in version 0.9.5.

21.19.85 salt.states.firewall module

State to check firewall configurations

New in version 2016.3.0.

`salt.states.firewall.check`(*name*, *port*=None, ***kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

name host name or ip address to test connection to

port The port to test the connection on

kwargs

Additional parameters, parameters allowed are: `proto` (tcp or udp) `family` (ipv4 or ipv6) `timeout`

```
testgoogle:
firewall.check:
- name: 'google.com'
- port: 80
- proto: 'tcp'
```

21.19.86 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewallld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewallld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewallld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewallld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewallld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

class salt.states.firewallld.**ForwardingMapping**(*srcport*, *destport*, *protocol*, *destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

todict()

Returns a pretty dictionary meant for command line output.

```
salt.states.firewalld.present(name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=False, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=None, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False)
```

Ensure a zone has specific attributes.

name The zone to modify.

default [None] Set this zone as the default zone if True.

masquerade [False] Enable or disable masquerade for a zone.

block_icmp [None] List of ICMP types to block in the zone.

prune_block_icmp [False] If True, remove all but the specified block_icmp from the zone.

ports [None] List of ports to add to the zone.

prune_ports [False] If True, remove all but the specified ports from the zone.

port_fwd [None] List of port forwards to add to the zone.

prune_port_fwd [False] If True, remove all but the specified port_fwd from the zone.

services [None] List of services to add to the zone.

prune_services [True] If True, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.

interfaces [None] List of interfaces to add to the zone.

prune_interfaces [False] If True, remove all but the specified interfaces from the zone.

sources [None] List of sources to add to the zone.

prune_sources [False] If True, remove all but the specified sources from the zone.

rich_rules [None] List of rich rules to add to the zone.

prune_rich_rules [False] If True, remove all but the specified rich rules from the zone.

```
salt.states.firewalld.service(name, ports=None, protocols=None)
```

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

21.19.87 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

addressable:

gem.installed:

- **user:** rvm
- **ruby:** jruby@jgemset

```
salt.states.gem.installed(name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)
```

Make sure that a gem is installed.

name The name of the gem to install

ruby: None Only for RVM or rbenv installations: the ruby version and gemset to target.

gem_bin: None Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

user: None The user under which to run the gem command

New in version 0.17.0.

version [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once
rdoc [False] Generate RDoc documentation for the gem(s).
ri [False] Generate RI documentation for the gem(s).
pre_releases [False] Install pre-release version of gem(s) if available.
proxy [None] Use the specified HTTP proxy server for all outgoing traffic. Format: `http://hostname[{}:port]`
source [None] Use the specified HTTP gem source server to download gem. Format: `http://hostname[{}:port]`

`salt.states.gem.removed` (*name*, *ruby=None*, *user=None*, *gem_bin=None*)

Make sure that a gem is not installed.

name The name of the gem to uninstall

gem_bin [None] Full path to gem binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

user: None The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_add` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.

name The URL of the gem source to be added

ruby: None For RVM or rbenv installations: the ruby version and gemset to target.

user: None The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_remove` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.

name The URL of the gem source to be removed

ruby: None For RVM or rbenv installations: the ruby version and gemset to target.

user: None The user under which to run the `gem` command

New in version 0.17.0.

21.19.88 salt.states.git

States to manage git repositories and git configuration

Important: Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.cloned` (*name*, *target=None*, *branch=None*, *user=None*, *password=None*, *identity=None*,
https_user=None, *https_pass=None*, *output_encoding=None*)

New in version 2018.3.3,2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

name Address of the remote repository

target Name of the target directory where repository should be cloned

branch Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

Note: The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched.

If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

- user** User under which to run git commands. By default, commands are run by the user under which the minion is running.
- password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
- identity** Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state's documentation for more information.
- https_user** HTTP Basic Auth username for HTTPS (only) clones
- https_pass** HTTP Basic Auth password for HTTPS (only) clones
- output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
-

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

`salt.states.git.config_set`(*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

- name** Name of the git config value to set
- value** Set a single value for the config item
- multivar** Set multiple values for the config item
-

Note: The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.

- repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.
- user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.
- password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- global** [False] If `True`, this will set a global git config option
- output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
-

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Local Config Example:

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

Global Config Example (User “foo“):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

`salt.states.git.config_unset`(*name*, *value_regex=None*, *repo=None*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

name The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

value_regex Regex indicating the values to unset for the matching key(s)

Note: This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

all [False] If `True`, unset all matches

repo Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global [False] If `True`, this will set a global git config option

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an

encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Examples:

```
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

`salt.states.git.detached`(*name*, *rev*, *target=None*, *remote='origin'*, *user=None*, *password=None*, *force_clone=False*, *force_checkout=False*, *fetch_remote=True*, *hard_reset=False*, *submodules=False*, *identity=None*, *https_user=None*, *https_pass=None*, *onlyif=None*, *unless=None*, *output_encoding=None*, ***kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from *rev*.

name Address of the remote repository.

rev The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

target Name of the target directory where repository is about to be cloned.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

force_clone [False] If the *target* directory exists and is not a git repository, then this state will fail. Set this argument to *True* to remove the contents of the target directory and clone the repo into it.

force_checkout [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to *True* to discard unwritten changes when checking out.

fetch_remote [True] If `False` a fetch will not be performed and only local refs will be reachable.
hard_reset [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

submodules [False] Update submodules
identity A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.
https_user HTTP Basic Auth username for HTTPS (only) clones
https_pass HTTP Basic Auth password for HTTPS (only) clones
onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true
unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false
output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

```
salt.states.git.latest(name, rev='HEAD', target=None, branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, refspec_branch='*', refspec_tag='*', output_encoding=None, **kwargs)
```

Make sure the repository is cloned to the given directory and is up-to-date.

name Address of the remote repository, as passed to `git clone`

Note: From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh:// URL`, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlasian Stash/BitBucket Server](#). In these cases, it may be necessary to use `ssh:// URLs` for SSH authentication.

rev [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at

all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

target Name of the target directory where repository is about to be cloned

branch Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

Note: If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

user Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

Note: This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

update_head [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

force_checkout [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

force_clone [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_fetch [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

force_reset [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to `remote-changes`, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

submodules [False] Update submodules on clone or branch change

bare [False] Set to `True` if the repository is to be a bare clone of the remote repository.

mirror Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

fetch_tags [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

sync_tags [True] If `True`, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2018.3.4.

depth Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

identity Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs

to authenticate.

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

https_user HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

https_pass HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

refspec_branch [*] A glob expression defining which branches to retrieve when fetching. See `git-fetch(1)` for more information on how refsspecs work.

New in version 2017.7.0.

refspec_tag [*] A glob expression defining which tags to retrieve when fetching. See `git-fetch(1)` for more information on how refsspecs work.

New in version 2017.7.0.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
```

(continues on next page)

(continued from previous page)

```

- target: /usr/share/nginx/staging
- identity: /root/.ssh/website_id_rsa
- require:
  - pkg: git
  - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

```

`salt.states.git.mod_run_check`(*cmd_kwargs, onlyif, unless*)

Execute the onlyif and unless logic. Return a result dict if:

- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0)

Otherwise, returns True

`salt.states.git.present`(*name, force=False, bare=True, template=None, separate_git_dir=None, shared=None, user=None, password=None, output_encoding=None*)

Ensure that a repository exists in the given directory

Warning: If the minion has Git 2.5 or later installed, `name` points to a `worktree`, and `force` is set to True, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

name Path to the directory

Changed in version 2015.8.0: This path must now be absolute

force [False] If True, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

bare [True] If True, and a repository must be initialized, then the repository will be a bare repository.

Note: This differs from the default behavior of `git.init`, make sure to set this value to False if a bare repo is not desired.

template If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

separate_git_dir If a new repository is initialized, this argument will specify an alternate \$GIT_DIR

New in version 2015.8.0.

shared Set sharing permissions on git repo. See [git-init\(1\)](#) for more details.

New in version 2015.5.0.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

21.19.89 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
  github.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

`salt.states.github.absent`(*name*, *profile='github'*, ***kwargs*)
Ensure a github user is absent

```
ensure user test is absent in github:
  github.absent:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

The following parameters are required:

name Github handle of the user in organization

`salt.states.github.present`(*name*, *profile='github'*, ***kwargs*)
Ensure a user is present

```
ensure user test is present in github:
  github.present:
    - name: 'gitexample'
```

The following parameters are required:

name This is the github handle of the user in the organization

`salt.states.github.repo_absent(name, profile='github', **kwargs)`

Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
  github.repo_absent:
    - name: 'test'
```

The following parameters are required:

name This is the name of the repository in the organization.

New in version 2016.11.0.

`salt.states.github.repo_present(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=False, gitignore_template=None, license_template=None, teams=None, profile='github', **kwargs)`

Ensure a repository is present

name This is the name of the repository.

description The description of the repository.

homepage The URL with more information about the repository.

private The visibility of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.

gitignore_template The desired language or platform for a .gitignore, e.g "Haskell".

license_template The desired LICENSE template to apply, e.g "mit" or "mozilla".

teams The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
  github.repo_present:
    - name: 'my-repo'
    - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.team_absent(name, profile='github', **kwargs)`

Ensure a team is absent.

Example:

```
ensure team test is present in github:
  github.team_absent:
    - name: 'test'
```

The following parameters are required:

name This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.team_present(name, description=None, repo_names=None, privacy='secret', permission='pull', members=None, enforce_mfa=False, no_mfa_grace_seconds=0, profile='github', **kwargs)`

Ensure a team is present

name This is the name of the team in the organization.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.

permission The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.

members The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce_mfa_from' and 'mfa_exempt'.

enforce_mfa Whether to enforce MFA requirements on members of the team. If True then all members without *mfa_exempt: True* configured will be removed from the team. Note that *no_mfa_grace_seconds* may be set to allow members a grace period.

no_mfa_grace_seconds The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce_mfa_from* on the member configuration, which defaults to 1970/01/01.

Example:

```

Ensure team test is present in github:
  github.team_present:
    - name: 'test'
    - members:
      user1: {}
      user2: {}

Ensure team test_mfa is present in github:
  github.team_present:
    - name: 'test_mfa'
    - members:
      user1:
        enforce_mfa_from: 2016/06/15
    - enforce_mfa: True

```

New in version 2016.11.0.

21.19.90 salt.states.glance

Managing Images in OpenStack Glance

salt.states.glance.image_present (*name*, *visibility='public'*, *protected=None*, *checksum=None*, *location=None*, *disk_format='raw'*, *wait_for=None*, *timeout=30*)

Checks if given image is present with properties set as specified.

An image should get through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don't specify 'wait_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

Supported properties:

- visibility ('public' or 'private')
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)
- disk_format ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

21.19.91 salt.states.glance_image

Management of OpenStack Glance Images

New in version 2018.3.0.

depends shade

configuration see *salt.modules.glanceng* for setup instructions

Example States

```
create image:
  glance_image.present:
    - name: cirros
    - filename: cirros.raw
    - image_format: raw

delete image:
  glance_image.absent:
    - name: cirros
```

`salt.states.glance_image.absent` (*name*, *auth=None*)

Ensure image does not exist

name Name of the image

`salt.states.glance_image.present` (*name*, *auth=None*, ***kwargs*)

Ensure image exists and is up-to-date

name Name of the image

enabled Boolean to control if image is enabled

description An arbitrary description of the image

21.19.92 salt.states.glusterfs

Manage GlusterFS pool.

`salt.states.glusterfs.add_volume_bricks` (*name*, *bricks*)

Add brick(s) to an existing volume

name Volume name

bricks List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.max_op_version` (*name*)

New in version 2019.2.0.

Add brick(s) to an existing volume

name Volume name

```

myvolume:
  glusterfs.max_op_version:
    - name: volume1
    - version: 30707

```

`salt.states.glusterfs.op_version(name, version)`

New in version 2019.2.0.

Add brick(s) to an existing volume

name Volume name

version Version to which the cluster.op-version should be set

```

myvolume:
  glusterfs.op_version:
    - name: volume1
    - version: 30707

```

`salt.states.glusterfs.peered(name)`

Check if node is peered.

name The remote host with which to peer.

```

peer-cluster:
  glusterfs.peered:
    - name: two

```

21.19.94 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

```

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)

```

Ensure GPG public key is absent in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Remove GPG keys from the specified user's keychain

gnupghome Override GNUPG Home directory

```

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)

```

Ensure GPG public key is present in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the specified user's keychain

keyserver The keyserver to retrieve the keys from.

gnupghome Override GNUPG Home directory

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

21.19.95 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify `elasticsearch` hosts directly to the module, or you can use an `elasticsearch` profile via pillars:

```

mygrafanaprofile:

```

```

  hosts:

```

```

    - es1.example.com:9200

```

```

    - es2.example.com:9200

```

```

  index: grafana-dash

```

```

# Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows_from_pillar:
    - systemhealth
    - requests

# Passing hosts in
Ensure myservice dashboard is managed:
grafana.dashboard_present:
  - name: myservice
  - dashboard_from_pillar: default
  - rows:
    - collapse: false
      editable: true
      height: 150px
      title: System Health
      panels:
        - aliasColors: {}
          id: 200000
          annotate:
            enable: false
          bars: false
          datasource: null
          editable: true
          error: false
          fill: 7
          grid:
            leftMax: 100
            leftMin: null
            rightMax: null
            rightMin: null
            threshold1: 60
            threshold1Color: rgb(216, 27, 27)
            threshold2: null
            threshold2Color: rgba(234, 112, 112, 0.22)
          leftYAxisLabel: ''
          legend:
            avg: false
            current: false
            max: false
            min: false
            show: false
            total: false
            values: false
          lines: true
          linewidth: 1
          nullPointMode: connected
          percentage: false
          pointradius: 5
          points: false
          renderer: flot
          resolution: 100
          scale: 1
          seriesOverrides: []

```

(continues on next page)

(continued from previous page)

```

  - requests
- profile: mygrafanaprofile

```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana.dashboard_absent (*name, hosts=None, profile='grafana'*)

Ensure the named grafana dashboard is deleted.

name Name of the grafana dashboard.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

salt.states.grafana.dashboard_present (*name, dashboard=None, dashboard_from_pillar=None, rows=None, rows_from_pillar=None, profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

dashboard A dict that defines a dashboard that should be managed.

dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

rows A list of grafana rows.

rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

21.19.96 salt.states.grafana4_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

```
Ensure minimum dashboard is managed:
grafana4_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
  - default_dashboard
- base_rows_from_pillar:
  - default_row
- base_panels_from_pillar:
  - default_panel
- dashboard:
  rows:
    - title: Usage
      panels:
        - targets:
            - target: alias(constantLine(50), 'max')
              title: Imaginary
              type: graph
```

salt.states.grafana4_dashboard.absent(*name*, *orgname=None*, *profile='grafana'*)

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_dashboard.present(*name*, *base_dashboards_from_pillar=None*, *base_panels_from_pillar=None*, *base_rows_from_pillar=None*, *dashboard=None*, *orgname=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from
base_rows_from_pillar A pillar key that contains a list of rows to inherit from
dashboard A dict that defines a dashboard that should be managed.
orgname Name of the organization in which the dashboard should be present.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.97 salt.states.grafana4_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

Ensure influxdb data source is present:

```
grafana4_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

salt.states.grafana4_datasource.absent(*name*, *orgname*=None, *profile*='grafana')

Ensure that a data source is present.

name Name of the data source to remove.

orgname Name of the organization from which the data source should be absent.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_datasource.present(*name*, *type*, *url*, *access*=None, *user*=None, *password*=None, *database*=None, *basic_auth*=None, *basic_auth_user*=None, *basic_auth_password*=None, *tls_auth*=None, *json_data*=None, *is_default*=None, *with_credentials*=None, *type_logo_url*=None, *orgname*=None, *profile*='grafana')

Ensure that a data source is present.

name Name of the data source.
type Type of the datasource ('graphite', 'influxdb' etc).
access Use proxy or direct. Default: proxy
url The URL to the data source API.
user Optional - user to authenticate with the data source.
password Optional - password to authenticate with the data source.
database Optional - database to use with the data source.
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
json_data Optional - additional json data to post (eg. "timeInterval").
is_default Optional - set data source as default.
with_credentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url Optional - Logo to use for this datasource.
orgname Name of the organization in which the data source should be present.
profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.98 salt.states.grafana4_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

Ensure foobar org is present:

```
grafana4_org.present:
- name: foobar
- theme: ""
- home_dashboard_id: 0
- timezone: "utc"
- address1: ""
- address2: ""
- city: ""
- zip_code: ""
- state: ""
- country: ""
```

`salt.states.grafana4_org.absent(name, profile='grafana')`

Ensure that a org is present.

name Name of the org to remove.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_org.present (*name, users=None, theme=None, home_dashboard_id=None, timezone=None, address1=None, address2=None, city=None, zip_code=None, address_state=None, country=None, profile='grafana'*)

Ensure that an organization is present.

name Name of the org.

users Optional - Dict of user/role associated with the org. Example:

```
users:
  foo: Viewer
  bar: Editor
```

theme Optional - Selected theme for the org.

home_dashboard_id Optional - Home dashboard for the org.

timezone Optional - Timezone for the org (one of: "browser", "utc", or "").

address1 Optional - address1 of the org.

address2 Optional - address2 of the org.

city Optional - city of the org.

zip_code Optional - zip_code of the org.

address_state Optional - state of the org.

country Optional - country of the org.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.99 salt.states.grafana4_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

Ensure foobar user is present:

grafana4_user.present:

- **name:** foobar
- **password:** mypass
- **email:** "foobar@localhost"
- **fullname:** Foo Bar
- **is_admin:** true

`salt.states.grafana4_user.absent(name, profile='grafana')`

Ensure that a user is present.

name Name of the user to remove.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_user.present(name, password, email, is_admin=False, fullname=None, theme=None, profile='grafana')`

Ensure that a user is present.

name Name of the user.

password Password of the user.

email Email of the user.

is_admin Optional - Set user as admin user. Default: False

fullname Optional - Full name of the user.

theme Optional - Selected theme of the user.

profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.100 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
  - default_dashboard
- base_rows_from_pillar:
  - default_row
- base_panels_from_pillar:
  - default_panel
- dashboard:
  rows:
  - title: Usage
    panels:
    - targets:
      - target: alias(constantLine(50), 'max')
        title: Imaginary
        type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana_dashboard.absent(name, profile='grafana')`

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

profile A pillar key or dict that contains grafana information

```
salt.states.grafana_dashboard.present(name, base_dashboards_from_pillar=None,
                                       base_panels_from_pillar=None,
                                       base_rows_from_pillar=None, dashboard=None,
                                       profile='grafana')
```

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from

dashboard A dict that defines a dashboard that should be managed.

profile A pillar key or dict that contains grafana information

21.19.101 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
```

```
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

```
salt.states.grafana_datasource.absent(name, profile='grafana')
```

Ensure that a data source is present.

name Name of the data source to remove.

```
salt.states.grafana_datasource.present(name, type, url, access='proxy', user="", password="",
                                       database="", basic_auth=False, basic_auth_user="",
                                       basic_auth_password="", is_default=False,
                                       json_data=None, profile='grafana')
```

Ensure that a data source is present.

name Name of the data source.

type Which type of data source it is ('graphite', 'influxdb' etc.).

url The URL to the data source API.

user Optional - user to authenticate with the data source

password Optional - password to authenticate with the data source

basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basic_auth_user Optional - HTTP basic auth username.

basic_auth_password Optional - HTTP basic auth password.

is_default Default: False

21.19.102 salt.states.grains

Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: /etc/salt/grains

Note: This does NOT override any grains set in the minion config file.

`salt.states.grains.absent` (*name*, *destructive=False*, *delimiter=':'*, *force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

name The grain name

destructive If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent
```

`salt.states.grains.append` (*name*, *value*, *convert=False*, *delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

name The grain name

value The value to append

convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

`salt.states.grains.exists` (*name*, *delimiter=':'*)

Ensure that a grain is set

name The grain name

delimiter A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

`salt.states.grains.list_absent` (*name*, *value*, *delimiter=':'*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

name The grain name.
value The value to delete from the grain list.
delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be `list type`

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

`salt.states.grains.list_present` (*name, value, delimiter=':'*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.

name The grain name.
value The value is present in the list type grain.
delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be `list type`

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.present` (*name, value, delimiter=':', force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.

name The grain name
value The value to set on the grain
force If force is True, the existing grain will be overwritten regardless of its existing or provided value type.
 Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value

different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ','
```

21.19.103 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2
```

`salt.states.group.absent(name)`

Ensure that the named group is absent

Parameters **name** (*str*) – The name of the group to remove

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

`salt.states.group.present`(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*)

Ensure that a group is present

Parameters

- **name** (*str*) – The name of the group to manage
- **gid** (*str*) – The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) – Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'. Ignored on Windows
- **addusers** (*list*) – List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** (*list*) – Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** (*list*) – Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

21.19.104 salt.states.heat module

Management of Heat

New in version 2017.7.0.

depends

- heat Python module

configuration See `salt.modules.heat` for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```

heat.deployed:
- name:
- template: #Required
- environment:
- params: {}
- poll: 5
- rollback: False
- timeout: 60

heat.absent:
- name:
- poll: 5

```

mysql:

heat.deployed:

- **template:** salt://templates/mysql.heat.yaml
- **params:** image: Debian 7
- **rollback:** True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

salt.states.heat.absent (*name, poll=5, timeout=60, profile=None*)

Ensure that the named stack is absent

name The name of the stack to remove

poll Poll(in sec.) and report events until stack complete

timeout Stack creation timeout in minutes

profile Profile to use

salt.states.heat.deployed (*name, template=None, environment=None, params=None, poll=5, rollback=False, timeout=60, update=False, profile=None, **connection_args*)

Deploy stack with the specified properties

name The name of the stack

template File of template

environment File of environment

params Parameter dict used to create the stack

poll Poll (in sec.) and report events until stack complete

rollback Enable rollback on create failure

timeout Stack creation timeout in minutes

profile Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

21.19.105 salt.states.hg

Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in `~/.ssh/known_hosts`, and the remote host has this host's public key.

```

https://bitbucket.org/example_user/example_repo:
hg.latest:

```

(continues on next page)

(continued from previous page)

```
- rev: tip
- target: /tmp/example_repo
```

`salt.states.hg.latest`(*name*, *rev=None*, *target=None*, *clean=False*, *user=None*, *identity=None*, *force=False*, *opts=False*, *update_head=True*)

Make sure the repository is cloned to the given directory and is up to date

name Address of the remote repository as passed to "hg clone"

rev The remote branch, tag, or revision hash to clone/pull

target Target destination directory path on minion to clone into

clean Force a clean update with -C (Default: False)

user Name of the user performing repository management operations

New in version 0.17.0.

identity Private SSH key on the minion server for authentication (`ssh://`)

New in version 2015.5.0.

force Force hg to clone into pre-existing directories (deletes contents)

opts Include additional arguments and options to the hg command line

update_head Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

21.19.106 salt.states.hipchat

Send a message to Hipchat

This state is useful for sending messages to Hipchat during state runs.

The property `api_url` is optional. By default will use the public HipChat API at <https://api.hipchat.com>

New in version 2015.5.0.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
```

The api key can be specified in the master or minion configuration like below:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

`salt.states.hipchat.send_message`(*name*, *room_id*, *from_name*, *message*, *api_url=None*, *api_key=None*, *api_version=None*, *message_color='yellow'*, *notify=False*)

Send a message to a Hipchat room.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
```

(continues on next page)

(continued from previous page)

```

- message: 'This state was executed successfully.'
- api_url: https://hipchat.myteam.com
- api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
- api_version: v1
- message_color: green
- notify: True

```

The following parameters are required:

name The unique name for this event.

room_id The room to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the "from" field. If not specified, defaults to.

message The message that is to be sent to the Hipchat room.

The following parameters are optional:

api_url The API URL to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: <https://api.hipchat.com>

api_key The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.

api_version The api version for Hipchat to use, if not specified in the configuration options of master or minion.

message_color The color the Hipchat message should be displayed in. One of the following, default: yellow "yellow", "red", "green", "purple", "gray", or "random".

notify Should a notification in the room be raised.

21.19.107 salt.states.host

Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```

salt-master:
  host.present:
    - ip: 192.168.0.42

```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```

server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida

```

Note: Changing the names in `host.present` does not cause an update to remove the old entry.

```

server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44

```

(continues on next page)

(continued from previous page)

```
- names:
  - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
host.only:
  - hostnames:
    - foo.example.com
    - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
host.only:
  - hostnames: []
```

`salt.states.host.absent` (*name*, *ip*)

Ensure that the named host is absent

name The host to remove

ip The ip addr(s) of the host to remove

`salt.states.host.only` (*name*, *hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name The IP address to associate with the given hostnames.

hostnames Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.present` (*name*, *ip*, *clean=False*)

Ensures that the named host is present with the given ip

name The host to assign an ip to

ip The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.

clean [False] Remove any entries which don't match those configured in the `ip` option.

New in version 2018.3.4.

21.19.108 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query` (*name*, *match=None*, *match_type='string'*, *status=None*, *wait_for=None*, ***kwargs*)

Perform an HTTP query and statefully return the result

Passes through all the parameters described in the `utils.http.query` function:

name The name of the query.

match Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text.

match_type Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcr` to use regular expression matching if a more complex pattern matching is required.

Note: Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

status The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200
```

`salt.states.http.wait_for_successful_query(name, wait_for=300, **kwargs)`

Like `query` but, repeat and wait until `match/match_type` or `status` is fulfilled. State returns result from last query state in case of success or if no successful query was made within `wait_for` timeout.

name The name of the query.

wait_for Total time to wait for requests that succeed.

request_interval Optional interval to delay requests by N seconds to reduce the number of requests sent.

Note: All other arguments are passed to the `http.query` state.

21.19.109 salt.states.icinga2 module

Icinga2 state

New in version 2017.7.0.

depends

- Icinga2 Python module

configuration See `salt.modules.icinga2` for setup instructions.

The `icinga2` module is used to execute commands. Its output may be stored in a file or in a grain.

```
command_id:
  icinga2.generate_ticket
  - name: domain.tld
  - output: "/tmp/query_id.txt"
```

`salt.states.icinga2.generate_cert(name)`

Generate an `icinga2` certificate and key on the client.

name The domain name for which this certificate and key will be generated

`salt.states.icinga2.generate_ticket(name, output=None, grain=None, key=None, overwrite=True)`

Generate an `icinga2` ticket on the master.

name The domain name for which this ticket will be generated

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need `output=grain`)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

`salt.states.icinga2.node_setup(name, master, ticket)`

Setup the icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

`salt.states.icinga2.request_cert(name, master, ticket, port='5665')`

Request CA certificate from master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

port Icinga2 port, defaults to 5665

`salt.states.icinga2.save_cert(name, master)`

Save the certificate on master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

21.19.110 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event(name, event, value1=None, value2=None, value3=None)`

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

name The unique name for this event.

event The name of the event to trigger in IFTTT.

The following parameters are optional:

value1 One of the values that we can send to IFTT.

value2 One of the values that we can send to IFTT.

value3 One of the values that we can send to IFFT.

21.19.111 salt.states.incron

Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
incron.present:
  - user: root
  - path: /home/user
  - mask:
    - IN_MODIFY
  - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
incron.present:
  - user: root
  - path: /home/user
  - mask:
    - IN_MODIFY
    - IN_ACCESS
  - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

salt.states.incron.absent(*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry

path The path that should be watched

user The name of the user who's crontab needs to be modified, defaults to the root user

mask The mask of events that should be monitored for

cmd The cmd that should be executed

salt.states.incron.present(*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

name Unique comment describing the entry

path The path that should be watched

user The name of the user who's crontab needs to be modified, defaults to the root user

mask The mask of events that should be monitored for

cmd The cmd that should be executed

21.19.112 salt.states.influxdb08_database module

Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.absent`(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Ensure that the named database is absent

name The name of the database to remove

user The user to connect as (must be able to remove the database)

password The password of the user

host The host to connect to

port The port to connect to

`salt.states.influxdb08_database.present`(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Ensure that the named database is present

name The name of the database to create

user The user to connect as (must be able to remove the database)

password The password of the user

host The host to connect to

port The port to connect to

21.19.113 salt.states.influxdb08_user module

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.absent`(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Ensure that the named cluster admin or database user is absent.

name The name of the user to remove

database The database to remove the user from

user The user to connect as (must be able to remove the user)

password The password of the user

host The host to connect to

port The port to connect to

`salt.states.influxdb08_user.present`(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Ensure that the cluster admin or database user is present.

name The name of the user to manage

passwd The password of the user

database The database to create the user in

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

21.19.114 salt.states.influxdb_continuous_query module

Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_continuous_query.absent(name, database, **client_args)`

Ensure that given continuous query is absent.

name Name of the continuous query to remove.

database Name of the database that the continuous query was defined on.

`salt.states.influxdb_continuous_query.present(name, database, query, resample_time=None, coverage_period=None, **client_args)`

Ensure that given continuous query is present.

name Name of the continuous query to create.

database Database to create continuous query on.

query The query content

resample_time [None] Duration between continuous query resampling.

coverage_period [None] Duration specifying time period per sample.

21.19.115 salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent(name, **client_args)`

Ensure that given database is absent.

name Name of the database to remove.

`salt.states.influxdb_database.present(name, **client_args)`

Ensure that given database is present.

name Name of the database to create.

21.19.116 salt.states.influxdb_retention_policy module

Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_retention_policy.absent(name, database, **client_args)`

Ensure that given retention policy is absent.

name Name of the retention policy to remove.

database Name of the database that the retention policy was defined on.

`salt.states.influxdb_retention_policy.convert_duration(duration)`

Convert the a duration string into XXhYYmZZs format

duration Duration to convert

Returns: duration_string String representation of duration in XXhYYmZZs format

`salt.states.influxdb_retention_policy.present`(*name*, *database*, *duration*='7d', *replication*=1, *default*=False, ***client_args*)

Ensure that given retention policy is present.
name Name of the retention policy to create.
database Database to create retention policy on.

21.19.117 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent`(*name*, ***client_args*)

Ensure that given user is absent.
name The name of the user to manage

`salt.states.influxdb_user.present`(*name*, *passwd*, *admin*=False, *grants*=None, ***client_args*)

Ensure that given user is present.
name Name of the user to manage
passwd Password of the user
admin [False] Whether the user should have cluster administration privileges or not.
grants Optional - Dict of database:privilege items associated with the user. Example:
 grants: foo_db: read bar_db: all

Example:

```
example user present in influxdb:
influxdb_user.present:
- name: example
- passwd: somepassword
- admin: False
- grants:
  foo_db: read
  bar_db: all
```

21.19.118 salt.states.infoblox_a

Infoblox A record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_a.absent`(*name*=None, *ipv4addr*=None, ***api_opts*)

Ensure infoblox A record is removed.

State example:

```
infoblox_a.absent:
- name: example-ha-0.domain.com

infoblox_a.absent:
- name:
- ipv4addr: 127.0.23.23
```

```
salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True,
                               **api_opts)
```

Ensure infoblox A record.

When you wish to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

State example:

```
infoblox_a.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  ipv4addr: 123.0.31.2
  view: Internal
```

21.19.119 salt.states.infoblox_cname

Infoblox CNAME management.

functions accept *api_opts*:

api_verifyssl: verify SSL [default to True or pillar value] *api_url*: server to connect to [default to pillar value] *api_username*: [default to pillar value] *api_password*: [default to pillar value]

```
salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)
```

Ensure the CNAME with the given name or canonical name is removed

```
salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)
```

Ensure the CNAME with the given data is present.

name CNAME of record

data raw CNAME api data see: <https://INFOBLOX/wapidoc>

State example:

```
infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  canonical: example.domain.com
  zone: example.com
  view: Internal
  comment: Example comment

infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  canonical: example.domain.com
  zone: example.com
  view: Internal
  comment: Example comment
- api_url: https://INFOBLOX/wapi/v1.2.1
- api_username: username
- api_password: passwd
```

21.19.120 salt.states.infoblox_host_record

Infoblox host record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_host_record.absent` (`name=None`, `ipv4addr=None`, `mac=None`, `**api_opts`)

Ensure the host with the given Name `ipv4addr` or `mac` is removed.

State example:

```
infoblox_host_record.absent:
- name: hostname.of.record.to.remove

infoblox_host_record.absent:
- name:
- ipv4addr: 192.168.0.1

infoblox_host_record.absent:
- name:
- mac: 12:02:12:31:23:43
```

`salt.states.infoblox_host_record.present` (`name=None`, `data=None`, `ensure_data=True`, `**api_opts`)

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data. If the host is not found then one will be created.

When trying to update a hostname ensure `name` is set to the hostname of the current record. You can give a new name in the `data.name`.

Avoid race conditions, use `func:nextavailableip`:

- `func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

State Example:

```
# this would update `original_hostname.example.ca` to changed `data`.
infoblox_host_record.present:
- name: original_hostname.example.ca
- data: {'name': 'hostname.example.ca',
        'aliases': ['hostname.math.example.ca'],
        'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}}],
        'ipv4addrs': [{'configure_for_dhcp': True,
                       'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                       'mac': '00:50:56:84:6e:ae'}],
        'ipv6addrs': [], }
```

21.19.121 salt.states.infoblox_range

Infoblox host record management.

functions accept `api_opts`:

api_verifyssl: verify SSL [default to True or pillar value] api_url: server to connect to [default to pillar value] api_username: [default to pillar value] api_password: [default to pillar value]

salt.states.infoblox_range.**absent**(*name=None, start_addr=None, end_addr=None, data=None, **api_opts*)

Ensure the range is removed

Supplying the end of the range is optional.

State example:

```
infoblox_range.absent:
- name: 'vlan10'

infoblox_range.absent:
- name:
- start_addr: 127.0.1.20
```

salt.states.infoblox_range.**present**(*name=None, start_addr=None, end_addr=None, data=None, **api_opts*)

Ensure range record is present.

infoblox_range.present: start_addr: '129.97.150.160', end_addr: '129.97.150.170',

Verbose state example:

```
infoblox_range.present:
  data: {
    'always_update_dns': False,
    'authority': False,
    'comment': 'range of IP addresses used for salt.. was used for ghost
↪images deployment',

'use_enable_dhcp_thresholds': False,
'use_enable_ifmap_publishing': False,
'use_ignore_dhcp_option_list_request': False,
'use_known_clients': False,
'use_lease_scavenge_time': False,
'use_nextserver': False,
'use_options': False,
'use_recycle_leases': False,
'use_unknown_clients': False,
'use_update_dns_on_lease_renewal': False
}

```

21.19.122 salt.states.ini_manage

Manage ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

salt.states.ini_manage.options_absent (*name*, *sections=None*, *separator='='*)

```

/home/saltminion/api-paste.ini:
ini.options_absent:
- separator: '='
- sections:
  test:
    - testkey
    - secondoption
  test1:
    - testkey1

```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present(name, sections=None, separator='=', strict=False)`

```
/home/saltminion/api-paste.ini:
ini.options_present:
- separator: '='
- strict: True
- sections:
  test:
    testkey: 'testval'
    secondoption: 'secondvalue'
  test1:
    testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless `strict: True` flag is used

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent(name, sections=None, separator='=')`

```
/home/saltminion/api-paste.ini:
ini.sections_absent:
- separator: '='
- sections:
  - test
  - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present(name, sections=None, separator='=')`

```
/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
  - section_one
  - section_two
```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

21.19.123 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```

ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None

```

Every call can override the config defaults:

```

ensure myipmi system is set to network boot:
  ipmi.boot_device:
    - name: network
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
    - api_kg: None

ensure myipmi system is powered on:
  ipmi.power:
    - name: boot
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword

```

`salt.states.ipmi.boot_device` (*name='default', **kwargs*)

Request power state change

name = default

- network – Request network boot
- hd – Boot from hard drive
- safe – Boot from hard drive, requesting 'safe mode'
- optical – boot from CD/DVD/BD drive
- setup – Boot into setup utility
- default – remove any IPMI directed boot device request

kwargs

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

`salt.states.ipmi.power` (*name='power_on', wait=300, **kwargs*)

Request power state change

name

Ensure power state one of:

- `power_on` – system turn on
- `power_off` – system turn off (without waiting for OS)
- `shutdown` – request OS proper shutdown
- `reset` – reset (without waiting for OS)
- `boot` – If system is off, then 'on', else 'reset'

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

`salt.states.ipmi.user_absent`(*name*, *channel=14*, ***kwargs*)

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

`salt.states.ipmi.user_present`(*name*, *uid*, *password*, *channel=14*, *callback=False*, *link_auth=True*, *ipmi_msg=True*, *privilege_level='administrator'*, ***kwargs*)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter `privilege_level`, for both callback and non-callback connections.

True = User Privilege Limit is determined by the `privilege_level` parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) `ipmi_msg`

privilege_level

- `callback`
- `user`
- `operator`
- `administrator`
- `proprietary`
- `no_access`

kwargs

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

21.19.124 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```

setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:
  ipset.set_absent:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

  ipset.flush:

```

`salt.states.ipset.absent` (*name*, *entry=None*, *entries=None*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

family Network family, ipv4 or ipv6.

`salt.states.ipset.flush` (*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Flush current ipset set

family Networking family, either ipv4 or ipv6

`salt.states.ipset.present` (*name*, *entry=None*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Append a entry to a set

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

entry A single entry to add to a set or a list of entries to add to a set

family Network family, ipv4 or ipv6.

```
salt.states.ipset.set_absent(name, family='ipv4', **kwargs)
```

New in version 2014.7.0.

Verify the set is absent.

family Networking family, either ipv4 or ipv6

```
salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)
```

New in version 2014.7.0.

Verify the set exists.

name A user-defined set name.

set_type The type for the set.

family Networking family, either ipv4 or ipv6

21.19.125 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```
httpd:
```

```
  iptables.append:
```

- **table:** filter

    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
    - chain: INPUT
    - policy: ACCEPT

```

Note: Whereas iptables will accept `-p, --proto[c[o[[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

Example rules for IPsec policy:

```

accept_esp_in:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - source: 10.20.0.0/24
    - destination: 10.10.0.0/24
    - in-interface: eth0
    - match: policy
    - dir: in
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_in:
  iptables.append:
    - use:

```

(continues on next page)

(continued from previous page)

```

- iptables: accept_esp_in
- chain: FORWARD

accept_esp_out:
iptables.append:
- table: filter
- chain: OUTPUT
- jump: ACCEPT
- source: 10.10.0.0/24
- destination: 10.20.0.0/24
- out-interface: eth0
- match: policy
- dir: out
- pol: ipsec
- reqid: 1
- proto: esp
accept_esp_forward_out:
iptables.append:
- use:
- iptables: accept_esp_out
- chain: FORWARD

```

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.append` (*name*, *table*=*'filter'*, *family*=*'ipv4'*, ***kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain.

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain which should be modified

family Network family, `ipv4` or `ipv6`.

All other arguments are passed in with the same name as the long option that would normally be used for `iptables`, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent` (*name*, *table*=*'filter'*, *family*=*'ipv4'*)

New in version 2014.1.0.

Verify the chain is absent.

table The table to remove the chain from

family Networking family, either `ipv4` or `ipv6`

`salt.states.iptables.chain_present` (*name*, *table*=*'filter'*, *family*=*'ipv4'*)

New in version 2014.1.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either `ipv4` or `ipv6`

`salt.states.iptables.delete` (*name*, *table*=*'filter'*, *family*=*'ipv4'*, ***kwargs*)

New in version 2014.1.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

```
salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)
```

New in version 2014.1.0.

Flush current iptables state

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

```
salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)
```

New in version 2014.1.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

position The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

```
salt.states.iptables.mod_aggregate(low, chunks, running)
```

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

```
salt.states.iptables.set_policy(name, table='filter', family='ipv4', **kwargs)
```

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

policy The requested table policy

21.19.126 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the `jboss-cli.sh` script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a `jboss_config` dictionary with the following properties must be passed:

```

jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'

```

If the controller doesn't require a password, then the `cli_user` and `cli_password` parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

For the sake of brevity, examples for each state assume that `jboss_config` is contained in the pillar.

`salt.states.jboss7.bindings_exist` (*name, jboss_config, bindings, profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

jboss_config: Dict with connection properties (see state description)

bindings: Dict with bindings to set.

profile: The profile name (domain mode only)

Example:

```

jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
      ↪properties'
    - jboss_config: {{ pillar['jboss'] }}

```

`salt.states.jboss7.datasource_exists` (*name, jboss_config, datasource_properties, recreate=False, profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

name Datasource property name

jboss_config Dict with connection properties (see state description)

datasource_properties Dict with datasource properties

recreate [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

profile [None] The profile name for this datasource (domain mode only)

Example:

```

sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
      driver-name: mysql
      connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
      jndi-name: 'java:jboss/datasources/sampleDS'
      user-name: sampleuser

```

(continues on next page)

(continued from previous page)

```

    password: secret
    min-pool-size: 3
    use-java-context: True
  - jboss_config: {{ pillar['jboss'] }}
  - profile: full-ha

```

`salt.states.jboss7.deployed`(*name*, *jboss_config*, *salt_source=None*)

Ensures that the given application is deployed on server.

jboss_config: Dict with connection properties (see state description)

salt_source:

How to find the artifact to be deployed.

target_file: Where to look in the minion's file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.

source: (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in **target_file** will be used for the deployment.

undeploy: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion's local file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}

```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of **salt_source** is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.reloaded`(*name*, *jboss_config*, *timeout=60*, *interval=5*)

Reloads configuration of jboss server.

jboss_config: Dict with connection properties (see state description)

timeout: Time to wait until jboss is back in running state. Default timeout is 60s.

interval: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease

waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

21.19.127 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.absent`(*name*, ***kwargs*)
Ensure the job is absent from the Jenkins configured jobs
name The name of the Jenkins job to remove

`salt.states.jenkins.present`(*name*, *config=None*, ***kwargs*)
Ensure the job is present in the Jenkins configured jobs
name The unique name for the Jenkins job
config The Salt URL for the file to use for configuring the job

21.19.128 salt.states.junos module

State modules to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to *junos* for information on connecting to junos proxy.

`salt.states.junos.cli`(*name*, ***kwargs*)
Executes the CLI commands and reuturns the text output.

```
show version:
  junos:
    - cli
    - format: xml
```

Parameters

- **Required** –
 - **command**: The command that need to be executed on Junos CLI. (default = None)
- **Optional** –

- **kwargs**: Keyworded arguments which can be provided like-
 - * **format**: Format in which to get the CLI output. (text or xml, default = 'text')
 - * **timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
 - * **dest**: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.commit(name, **kwargs)`

Commits the changes loaded into the candidate configuration.

```
commit the changes:
```

```
  junos:
    - commit
    - confirm: 10
```

Parameters **Optional** -

- **kwargs**: Keyworded arguments which can be provided like-
 - **timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
 - **comment**: Provide a comment to the commit. (default = None)
 - **confirm**: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolledback in the given time unless the commit is confirmed.
 - **sync**: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
 - **force_sync**: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
 - **full**: When set to True requires all the daemons to check and evaluate the new configuration.
 - **detail**: When true return commit detail.

`salt.states.junos.commit_check(name)`

Perform a commit check on the configuration.

```
perform commit check:
```

```
  junos.commit_check
```

`salt.states.junos.diff(name, d_id)`

Gets the difference between the candidate and the current configuration.

```
get the diff:
```

```
  junos:
    - diff
    - id: 10
```

Parameters **Optional** -

- **id**: The rollback id value [0-49]. (default = 0)

`salt.states.junos.file_copy(name, dest=None, **kwargs)`

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
```

```
  junos:
```

(continues on next page)

(continued from previous page)

```
- file_copy
- dest: info_copy.txt
```

Parameters Required –

- **src:** The source path where the file is kept.
- **dest:** The destination path where the file will be copied.

`salt.states.junos.install_config(name, **kwargs)`

Loads and commits the configuration provided.

Install the mentioned config:

```
junos:
- install_config
- path: salt//configs/interface.set
- timeout: 100
- diffs_file: 'var/log/diff'
```

Install the mentioned config:

```
junos:
- install_config
- template_path: salt//configs/interface.set
- timeout: 100
- template_vars:
  interface_name: lo0
  description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands

template_vars The dictionary of data for the jinja variables present in the jinja template

timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite [False]

Set to **True** if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

comment Provide a comment to the commit. (default = None)

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

Note: The file will be stored on the proxy minion. To push the files to the master use `cp.push`.

`salt.states.junos.install_os(name, **kwargs)`

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
salt://images/junos_image.tgz:
junos:
- install_os
- timeout: 100
- reboot: True
```

Parameters

- **Required** –
 - path: Path where the image file is present on the proxy minion.
- **Optional** –
 - kwargs: keyworded arguments to be given such as timeout, reboot etc
 - * timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
 - * reboot: Whether to reboot after installation (default = False)
 - * no_copy: When True the software package will not be SCP'd to the device. (default = False)

`salt.states.junos.load(name, **kwargs)`

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
junos:
- load
- path: salt//configs/interface.set
```

```
Install the mentioned config:
junos:
- load
- template_path: salt//configs/interface.set
- template_vars:
  interface_name: lo0
  description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a *.conf extension, the content is treated as text format. If the file has a *.xml extension, the content is treated as XML format. If the file has a *.set extension, the content is treated as Junos OS set commands.

overwrite [False] Set to True if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

format: Determines the format of the contents.

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)

template_vars Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.states.junos.lock(name)`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

```
lock the config:
junos.lock
```

`salt.states.junos.resultdecorator(function)`

`salt.states.junos.rollback(name, id, **kwargs)`

Rollbacks the committed changes.

rollback the changes:

```

junos:
- rollback
- id: 5

```

Parameters Optional –

- **id:** The rollback id value [0-49]. (default = 0)
- **kwargs:** **Keyworded arguments which can be provided like-**
 - **timeout:** Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
 - **comment:** Provide a comment to the commit. (default = None)
 - **confirm:** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
 - **diffs_file:** Path to the file where any diffs will be written. (default = None)

`salt.states.junos.rpc`(*name*, *dest=None*, *format='xml'*, *args=None*, ***kwargs*)

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with *dest* as an argument

get-interface-information:

```

junos:
- rpc
- dest: /home/user/rpc.log
- interface_name: lo0

```

Parameters

- **Required** –
 - **cmd:** The rpc to be executed. (default = None)
- **Optional** –
 - **dest:** Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: `cp.push`
 - **format:** The format in which the rpc reply must be stored in file specified in the *dest* (used only when *dest* is specified) (default = xml)
 - **kwargs:** **keyworded arguments taken by rpc call like-**
 - * **timeout:** Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
 - * **filter:** Only to be used with 'get-config' rpc to get specific configuration.
 - * **terse:** Amount of information you want.
 - * **interface_name:** Name of the interface whose information you want.

`salt.states.junos.set_hostname`(*name*, ***kwargs*)

Changes the hostname of the device.

device_name:

```

junos:
- set_hostname
- comment: "Host-name set via saltstack."

```

Parameters

- **Required** –
 - **hostname:** The name to be set. (default = None)
- **Optional** –

- **kwargs**: Keyworded arguments which can be provided like-
 - * **timeout**: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
 - * **comment**: Provide a comment to the commit. (default = None)
 - * **confirm**: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

`salt.states.junos.shutdown(name, **kwargs)`

Shuts down the device.

```
shut the device:
  junos:
    - shutdown
    - in_min: 10
```

Parameters **Optional** -

- **kwargs**:
 - **reboot**: Whether to reboot instead of shutdown. (default=False)
 - **at**: Specify time for reboot. (To be used only if reboot=yes)
 - **in_min**: Specify delay in minutes for shutdown

`salt.states.junos.unlock(name)`

Unlocks the candidate configuration.

```
unlock the config:
  junos.unlock
```

`salt.states.junos.zeroize(name)`

Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

21.19.129 salt.states.kapacitor module

Kapacitor state module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.task_absent(name)`

Ensure that a task is absent from Kapacitor.

name Name of the task.

`salt.states.kapacitor.task_present`(*name*, *tick_script*, *task_type*='stream', *database*=None, *retention_policy*='default', *enable*=True, *dbrps*=None)

Ensure that a task is present and up-to-date in Kapacitor.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a salt:// source.

task_type Task type. Defaults to 'stream'

dbrps A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrps.

New in version 2019.2.0.

database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

retention_policy Which retention policy to fetch data from. Defaults to 'default'.

enable Whether to enable the task or not. Defaults to True.

21.19.130 salt.states.kernelpkg

Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```
install-latest-kernel:
  kernel.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```
boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
```

Example state chaining the install and reboot operations:

```
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
    - onchanges:
      - kernel: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_wait:
    - at_time: 1
    - listen:
      - kernel: install-latest-kernel
```

`salt.states.kernelpkg.latest_active`(*name*, *at_time*=None, ***kwargs*)

Initiate a reboot if the running kernel is not the latest one installed.

Note: This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will

reboot the system.

See *kernelpkg.upgrade* and *latest_installed()* for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See *latest_wait()* for a waitable state that can be called with the *listen* requisite.

name Arbitrary name for the state. Does not affect behavior.

at_time The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.latest_installed(name, **kwargs)`

Ensure that the latest version of the kernel available in the repositories is installed.

Note: This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See *kernelpkg.needs_reboot* for details on how to detect this condition, and *latest_active()* to initiate a reboot when needed.

name Arbitrary name for the state. Does not affect behavior.

`salt.states.kernelpkg.latest_wait(name, at_time=None, **kwargs)`

Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of *latest_active()* and will not take any action unless triggered by a watch or listen requisite.

Note: Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using *listen* or *listen_in* requisites.

```
system-up-to-date:
  pkg.uptodate:
    - refresh: true

boot-latest-kernel:
  kernelpkg.latest_wait:
    - at_time: 1
    - listen:
      - pkg: system-up-to-date
```

name Arbitrary name for the state. Does not affect behavior.

at_time The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)`

Execute a kernelpkg state based on a watch or listen call

21.19.131 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

`salt.states.keyboard.system(name)`

Set the keyboard layout for the system

name The keyboard layout to use

`salt.states.keyboard.xorg(name)`

Set the keyboard layout for XOrg

layout The keyboard layout to use

21.19.132 salt.states.keystone

Management of Keystone users

depends

- keystoneclient Python module

configuration See `salt.modules.keystone` for setup instructions.

```
Keystone tenants:
```

```
keystone.tenant_present:
```

- **names:**
 - admin
 - demo
 - service

```
Keystone roles:
```

```
keystone.role_present:
```

- **names:**
 - admin
 - Member

```
admin:
```

```
keystone.user_present:
```

- **password:** R00T_4CC3SS
- **email:** admin@domain.com
- **roles:**
 - admin:** # tenants
 - admin # roles
 - service:**
 - admin
 - Member
- **require:**
 - **keystone:** Keystone tenants
 - **keystone:** Keystone roles

```
nova:
```

```
keystone.user_present:
```

- **password:** '\$up3rn0v4'
- **email:** nova@domain.com
- **tenant:** service
- **roles:**
 - service:**

(continues on next page)

(continued from previous page)

```

    - admin
  - require:
    - keystone: Keystone tenants
    - keystone: Keystone roles

demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
      demo:
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

```

`salt.states.keystone.endpoint_absent`(*name*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

name The name of the service whose endpoints should not exist

region (optional) The region of the endpoint. Defaults to `RegionOne`.

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.endpoint_present`(*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region=None*, *profile=None*, *url=None*, *interface=None*, ***connection_args*)

Ensure the specified endpoints exists for service

name The Service name

publicurl The public url of service endpoint (for V2 API)

internalurl The internal url of service endpoint (for V2 API)

adminurl The admin url of the service endpoint (for V2 API)

region The region of the endpoint

url The endpoint URL (for V3 API)

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.project_absent`(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project that should not exist

```

delete_nova:
  keystone.project_absent:
    - name: nova

```

`salt.states.keystone.project_present`(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone project exists Alias for `tenant_present` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project to manage

description The description to use for this project

enabled Availability state for this project

```
nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'
```

`salt.states.keystone.role_absent` (*name*, *profile=None*, ***connection_args*)

Ensure that the keystone role is absent.

name The name of the role that should not exist

`salt.states.keystone.role_present` (*name*, *profile=None*, ***connection_args*)

Ensures that the keystone role exists

name The name of the role that should be present

`salt.states.keystone.service_absent` (*name*, *profile=None*, ***connection_args*)

Ensure that the service doesn't exist in Keystone catalog

name The name of the service that should not exist

`salt.states.keystone.service_present` (*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)

Ensure service present in Keystone catalog

name The name of the service

service_type The type of Openstack Service

description (optional) Description of the service

`salt.states.keystone.tenant_absent` (*name*, *profile=None*, ***connection_args*)

Ensure that the keystone tenant is absent.

name The name of the tenant that should not exist

`salt.states.keystone.tenant_present` (*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone tenant exists

name The name of the tenant to manage

description The description to use for this tenant

enabled Availability state for this tenant

`salt.states.keystone.user_absent` (*name*, *profile=None*, ***connection_args*)

Ensure that the keystone user is absent.

name The name of the user that should not exist

`salt.states.keystone.user_present` (*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password_reset=True*, *project=None*, ***connection_args*)

Ensure that the keystone user is present with the specified properties.

name The name of the user to manage

password The password to use for this user.

Note: If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

password_reset Whether or not to reset password after initial set. Defaults to `True`.

email The email address for this user

tenant The tenant (name) for this user

- project** The project (name) for this user (overrides tenant in api v3)
- enabled** Availability state for this user
- roles** The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
  admin:  # tenant
    - admin # role
  service:
    - admin
    - Member
```

21.19.133 salt.states.keystone_domain

Management of OpenStack Keystone Domains

New in version 2018.3.0.

depends shade

configuration see *salt.modules.keystoneng* for setup instructions

Example States

```
create domain:
  keystone_domain.present:
    - name: domain1

create domain with optional params:
  keystone_domain.present:
    - name: domain1
    - enabled: False
    - description: 'my domain'

delete domain:
  keystone_domain.absent:
    - name: domain1
```

`salt.states.keystone_domain.absent`(*name*, *auth=None*)

Ensure domain does not exist

name Name of the domain

`salt.states.keystone_domain.present`(*name*, *auth=None*, ***kwargs*)

Ensure domain exists and is up-to-date

name Name of the domain

enabled Boolean to control if domain is enabled

description An arbitrary description of the domain

21.19.134 salt.states.keystone_endpoint

Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

depends shade

configuration see *salt.modules.keystoneng* for setup instructions

Example States

```

create endpoint:
  keystone_endpoint.present:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

destroy endpoint:
  keystone_endpoint.absent:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

create multiple endpoints:
  keystone_endpoint.absent:
    - names:
      - public
      - admin
      - internal
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

```

`salt.states.keystone_endpoint.absent` (*name, service_name, auth=None, **kwargs*)

Ensure an endpoint does not exist

name Interface name

url URL of the endpoint

service_name Service name or ID

region The region name to assign the endpoint

`salt.states.keystone_endpoint.present` (*name, service_name, auth=None, **kwargs*)

Ensure an endpoint exists and is up-to-date

name Interface name

url URL of the endpoint

service_name Service name or ID

region The region name to assign the endpoint

enabled Boolean to control if endpoint is enabled

21.19.135 salt.states.keystone_group

Management of OpenStack Keystone Groups

New in version 2018.3.0.

depends shade

configuration see *salt.modules.keystoneng* for setup instructions

Example States

```

create group:
  keystone_group.present:

```

(continues on next page)

(continued from previous page)

```

- name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

```

`salt.states.keystone_group.absent` (*name*, *auth=None*, ***kwargs*)

Ensure group does not exist

name Name of the group

domain The name or id of the domain

`salt.states.keystone_group.present` (*name*, *auth=None*, ***kwargs*)

Ensure an group exists and is up-to-date

name Name of the group

domain The name or id of the domain

description An arbitrary description of the group

21.19.136 salt.states.keystone_project

Management of OpenStack Keystone Projects

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```

create project:
  keystone_project.present:
    - name: project1

delete project:
  keystone_project.absent:
    - name: project1

create project with optional params:
  keystone_project.present:
    - name: project1
    - domain: domain1
    - enabled: False
    - description: 'my project'

```

`salt.states.keystone_project.absent` (*name*, *auth=None*, ***kwargs*)

Ensure a project does not exists

name Name of the project

domain The name or id of the domain

`salt.states.keystone_project.present` (*name*, *auth=None*, ***kwargs*)

Ensure a project exists and is up-to-date

name Name of the project

domain The name or id of the domain

description An arbitrary description of the project

21.19.137 salt.states.keystone_role

Management of OpenStack Keystone Roles

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create role:
  keystone_role.present:
    - name: role1

delete role:
  keystone_role.absent:
    - name: role1

create role with optional params:
  keystone_role.present:
    - name: role1
    - description: 'my group'
```

`salt.states.keystone_role.absent` (*name*, *auth=None*, ***kwargs*)

Ensure role does not exist

name Name of the role

`salt.states.keystone_role.present` (*name*, *auth=None*, ***kwargs*)

Ensure an role exists

name Name of the role

description An arbitrary description of the role

21.19.138 salt.states.keystone_role_grant

Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create group:
  keystone_group.present:
    - name: group1
```

(continues on next page)

(continued from previous page)

```

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

```

`salt.states.keystone_role_grant.absent`(*name*, *auth=None*, ***kwargs*)

`salt.states.keystone_role_grant.present`(*name*, *auth=None*, ***kwargs*)

21.19.139 salt.states.keystone_service

Management of OpenStack Keystone Services

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```

create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

create service with optional params:
  keystone_service.present:
    - name: glance
    - type: image
    - enabled: False
    - description: 'OpenStack Image'

```

`salt.states.keystone_service.absent`(*name*, *auth=None*)

Ensure service does not exist

name Name of the service

`salt.states.keystone_service.present`(*name*, *auth=None*, ***kwargs*)

Ensure an service exists and is up-to-date

name Name of the group

type Service type

enabled Boolean to control if service is enabled

description An arbitrary description of the service

21.19.140 salt.states.keystone_user

Management of OpenStack Keystone Users

New in version 2018.3.0.

depends shade

configuration see *salt.modules.keystoneng* for setup instructions

Example States

```
create user:
  keystone_user.present:
    - name: user1

delete user:
  keystone_user.absent:
    - name: user1

create user with optional params:
  keystone_user.present:
    - name: user1
    - domain: domain1
    - enabled: False
    - password: password123
    - email: "user1@example.org"
    - description: 'my user'
```

`salt.states.keystone_user.absent` (*name*, *auth=None*, ***kwargs*)

Ensure user does not exists

name Name of the user

domain The name or id of the domain

`salt.states.keystone_user.present` (*name*, *auth=None*, ***kwargs*)

Ensure domain exists and is up-to-date

name Name of the domain

domain The name or id of the domain

enabled Boolean to control if domain is enabled

description An arbitrary description of the domain

password The user password

email The users email address

21.19.141 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd

remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```

add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd

```

`salt.states.kmod.absent` (*name, persist=False, comment=True, mods=None*)

Verify that the named kernel module is not loaded

name The name of the kernel module to verify is not loaded

persist Remove module from `/etc/modules`

comment Comment out module in `/etc/modules` rather than remove it

mods A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

`salt.states.kmod.present` (*name, persist=False, mods=None*)

Ensure that the specified kernel module is loaded

name The name of the kernel module to verify is loaded

persist Also add module to `/etc/modules`

mods A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

21.19.142 salt.states.kubernetes

Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See `salt.modules.kubernetesmod` for more information.

Warning: Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

```

my-nginx:
  kubernetes.deployment_present:

```

`salt.states.kubernetes.configmap_absent`(*name*, *namespace='default'*, ***kwargs*)

Ensures that the named configmap is absent from the given namespace.

name The name of the configmap

namespace The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

`salt.states.kubernetes.configmap_present`(*name*, *namespace='default'*, *data=None*, *source=None*, *template=None*, ***kwargs*)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

name The name of the configmap.

namespace The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

data The dictionary holding the configmaps.

source A file containing the data of the configmap in plain format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.deployment_absent(name, namespace='default', **kwargs)`

Ensures that the named deployment is absent from the given namespace.

name The name of the deployment

namespace The name of the namespace

`salt.states.kubernetes.deployment_present(name, namespace='default', metadata=None, spec=None, source="", template="", **kwargs)`

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the deployment.

namespace The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the deployment object.

spec The spec of the deployment object.

source A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.namespace_absent(name, **kwargs)`

Ensures that the named namespace is absent.

name The name of the namespace

`salt.states.kubernetes.namespace_present(name, **kwargs)`

Ensures that the named namespace is present.

name The name of the namespace.

`salt.states.kubernetes.node_label_absent(name, node, **kwargs)`

Ensures that the named label is absent from the node.

name The name of the label

node The name of the node

`salt.states.kubernetes.node_label_folder_absent(name, node, **kwargs)`

Ensures the label folder doesn't exist on the specified node.

name The name of label folder

node The name of the node

`salt.states.kubernetes.node_label_present(name, node, value, **kwargs)`

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

name The name of the label.

value Value of the label.

node Node to change.

`salt.states.kubernetes.pod_absent(name, namespace='default', **kwargs)`

Ensures that the named pod is absent from the given namespace.

name The name of the pod

namespace The name of the namespace

`salt.states.kubernetes.pod_present(name, namespace='default', metadata=None, spec=None, source="", template="", **kwargs)`

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If

the pod exists it will be replaced.

name The name of the pod.

namespace The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the pod object.

spec The spec of the pod object.

source A file containing the definition of the pod (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.secret_absent(name, namespace='default', **kwargs)`

Ensures that the named secret is absent from the given namespace.

name The name of the secret

namespace The name of the namespace

`salt.states.kubernetes.secret_present(name, namespace='default', data=None, source=None, template=None, **kwargs)`

Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

name The name of the secret.

namespace The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.

data The dictionary holding the secrets.

source A file containing the data of the secret in plain format.

template Template engine to be used to render the source file.

`salt.states.kubernetes.service_absent(name, namespace='default', **kwargs)`

Ensures that the named service is absent from the given namespace.

name The name of the service

namespace The name of the namespace

`salt.states.kubernetes.service_present(name, namespace='default', metadata=None, spec=None, source="", template="", **kwargs)`

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the service.

namespace The namespace holding the service. The 'default' one is going to be used unless a different one is specified.

metadata The metadata of the service object.

spec The spec of the service object.

source A file containing the definition of the service (metadata and spec) in the official kubernetes format.

template Template engine to be used to render the source file.

21.19.143 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

sunrise:

```
layman.present
```

`salt.states.layman.absent(name)`

Verify that the overlay is absent

name The name of the overlay to delete

`salt.states.layman.present`(*name*)
 Verify that the overlay is present
name The name of the overlay to add

21.19.144 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed`(*name, entries, connect_spec=None*)
 Ensure the existence (or not) of LDAP entries and their attributes

Example:

```

ldapi:///:
  ldap.managed:
    - connect_spec:
      bind:
        method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
        - delete_others: True

      # make sure the entry exists with only the specified
      # attribute values
      - cn=admin,dc=example,dc=com:
        - delete_others: True
        - replace:
            cn:
              - admin
            description:
              - LDAP administrator
            objectClass:
              - simpleSecurityObject
              - organizationalRole
            userPassword:
              - {{pillar.ldap_admin_password}}

      # make sure the entry exists, its olcRootDN attribute
      # has only the specified value, the olcRootDN attribute
      # doesn't exist, and all other attributes are ignored
      - 'olcDatabase={1}hdb,cn=config':
        - replace:
            olcRootDN:
              - cn=admin,dc=example,dc=com
            # the admin entry has its own password attribute
            olcRootPW: []

      # note the use of 'default'. also note how you don't
      # have to use list syntax if there is only one attribute
      # value
  
```

(continues on next page)

(continued from previous page)

```

- cn=foo,ou=users,dc=example,dc=com:
- delete_others: True
- default:
  userPassword: changeme
  shadowLastChange: 0
  # keep sshPublicKey if present, but don't create
  # the attribute if it is missing
  sshPublicKey: []
- replace:
  cn: foo
  uid: foo
  uidNumber: 1000
  gidNumber: 1000
  gecos: Foo Bar
  givenName: Foo
  sn: Bar
  homeDirectory: /home/foo
  loginShell: /bin/bash
  objectClass:
    - inetOrgPerson
    - posixAccount
    - top
    - ldapPublicKey
    - shadowAccount

```

Parameters

- **name** – The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** – A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```

[{'dn1': [{'directive1': directive1_state,
          directive2': directive2_state},
         {'directive3': directive3_state}],
 'dn2': [{'directive4': directive4_state,
          directive5': directive5_state}]},
 {'dn3': [{'directive6': directive6_state}]}]

```

These are the directives:

- **'delete_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the

- **'default'** directive or the **'add'** directive with an empty value list.
- **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the **'delete_others'** key is **True**.

- **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the **'delete_others'** key is **True**.

- **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.
- **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be **None**, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect_spec** - See the description of the **connect_spec** parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the **'url'** entry is not specified, the **'url'** entry is set to the value of the **name** parameter.

Returns

A dict with the following keys:

- **'name'** This is the same object passed to the **name** parameter.
- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to **None**. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
- **'new'** The state of the entry after modification. If the entry was deleted, this key maps to **None**. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example **'changes'** dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
         'new': {'attr1': ['val1', 'val2']}}}
```

Example **'changes'** dict where a new attribute was added to an existing en-

try:

```
{'dn1': {'old': {},
        'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
 - True if no changes were necessary or if all changes were applied successfully.
 - False if at least one change was unable to be applied.
 - None if changes would be applied but it is in test mode.

21.19.145 salt.states.libcloud_dns module

Manage DNS records and zones using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

configuration This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
    - profile: profile1
my-website:
  libcloud_dns.record_present:
    - name: www
    - zone: mywebsite.com
    - type: A
    - data: 12.34.32.3
    - profile: profile1
    - require:
      - libcloud_dns: my-zone
```

depends apache-libcloud

salt.states.libcloud_dns.record_absent(*name, zone, type, data, profile*)

Ensures a record is absent.

Parameters

- **name** (str) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.

- **zone** (str) – Zone where the requested record is created, the domain name
- **type** (str) – DNS record type (A, AAAA, ...).
- **data** (str) – Data for the record (depends on the record type).
- **profile** (str) – The profile key

`salt.states.libcloud_dns.record_present`(*name, zone, type, data, profile*)

Ensures a record is present.

Parameters

- **name** (str) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone** (str) – Zone where the requested record is created, the domain name
- **type** (str) – DNS record type (A, AAAA, ...).
- **data** (str) – Data for the record (depends on the record type).
- **profile** (str) – The profile key

`salt.states.libcloud_dns.state_result`(*result, message, name, changes=None*)

`salt.states.libcloud_dns.zone_absent`(*domain, profile*)

Ensures a record is absent.

Parameters

- **domain** (str) – Zone name, i.e. the domain name
- **profile** (str) – The profile key

`salt.states.libcloud_dns.zone_present`(*domain, type, profile*)

Ensures a record is present.

Parameters

- **domain** (str) – Zone name, i.e. the domain name
- **type** (str) – Zone type (master / slave), defaults to master
- **profile** (str) – The profile key

21.19.146 salt.states.libcloud_loadbalancer module

Apache Libcloud Load Balancer State

Manage load balancers using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Cloud providers

```
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

Example:

Using States to deploy a load balancer with extended arguments to specify region

```
lb_test:
  libcloud_loadbalancer.balancer_present:
    - name: example
    - port: 80
    - protocol: http
    - profile: google
    - ex_region: us-east1
```

depends apache-libcloud

`salt.states.libcloud_loadbalancer.balancer_absent`(*name*, *profile*, ***libcloud_kwargs*)

Ensures a load balancer is absent.

Parameters

- **name** (str) – Load Balancer name
- **profile** (str) – The profile key

`salt.states.libcloud_loadbalancer.balancer_present`(*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, ***libcloud_kwargs*)

Ensures a load balancer is present.

Parameters

- **name** (str) – Load Balancer name
- **port** (str) – Port the load balancer should listen on, defaults to 80
- **protocol** (str) – Loadbalancer protocol, defaults to http.
- **profile** (str) – The profile key
- **algorithm** (str) – Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **members** (list of dict (ip, port)) – An optional list of members to create on deployment

`salt.states.libcloud_loadbalancer.member_absent`(*ip*, *port*, *balancer_id*, *profile*, ***libcloud_kwargs*)

Ensure a load balancer member is absent, based on IP and Port

Parameters

- **ip** (str) – IP address for the member
- **port** (int) – Port for the member
- **balancer_id** (str) – id of a load balancer you want to detach the member from
- **profile** (str) – The profile key

`salt.states.libcloud_loadbalancer.member_present`(*ip*, *port*, *balancer_id*, *profile*, ***libcloud_kwargs*)

Ensure a load balancer member is present

Parameters

- **ip** (str) – IP address for the new member
- **port** (int) – Port for the new member
- **balancer_id** (str) – id of a load balancer you want to attach the member to
- **profile** (str) – The profile key

`salt.states.libcloud_loadbalancer.state_result`(*result*, *message*, *name*, *changes=None*)

21.19.147 salt.states.libcloud_storage module

Apache Libcloud Storage State

Manage cloud storage using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

Examples

Creating a container and uploading a file

```
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

Downloading a file

This example will download the file from the remote cloud and keep it locally

```
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

depends apache-libcloud

salt.states.libcloud_storage.container_absent (*name*, *profile*)

Ensures a container is absent.

Parameters

- **name** (str) – Container name

- **profile** (str) – The profile key

`salt.states.libcloud_storage.container_present`(*name*, *profile*)

Ensures a container is present.

Parameters

- **name** (str) – Container name
- **profile** (str) – The profile key

`salt.states.libcloud_storage.file_present`(*container*, *name*, *path*, *profile*, *overwrite_existing=False*)

Ensures a object is downloaded locally.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **path** (str) – Local path to file
- **profile** (str) – The profile key
- **overwrite_existing** (bool) – Replace if already exists

`salt.states.libcloud_storage.object_absent`(*container*, *name*, *profile*)

Ensures a object is absent.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **profile** (str) – The profile key

`salt.states.libcloud_storage.object_present`(*container*, *name*, *path*, *profile*)

Ensures a object is present.

Parameters

- **container** (str) – Container name
- **name** (str) – Object name in cloud
- **path** (str) – Local path to file
- **profile** (str) – The profile key

`salt.states.libcloud_storage.state_result`(*result*, *message*, *name*, *changes*)

21.19.148 salt.states.linux_acl

Linux File Access Control Lists

The Linux ACL state module requires the `getfacl` and `setfacl` binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL list is present

```
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_name:
      - damian
      - homer
    - perms: rwx
```

Ensure a Linux ACL list does not exist

```
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_name:
      - damian
      - homer
    - perms: rwx
```

`salt.states.linux_acl.absent(name, acl_type, acl_name="", perms="", recurse=False)`

Ensure a Linux ACL does not exist

name The acl path

acl_type The type of the acl is used for, it can be 'user' or 'group'

acl_names The user or group

perms Remove the permissions eg.: rwx

recurse Set the permissions recursive in the path

`salt.states.linux_acl.list_absent(name, acl_type, acl_names=None, recurse=False)`

Ensure a Linux ACL list does not exist

Takes a list of acl names and remove them from the given path

name The acl path

acl_type The type of the acl is used for, it can be 'user' or 'group'

acl_names The list of users or groups

perms Remove the permissions eg.: rwx

recurse Set the permissions recursive in the path

`salt.states.linux_acl.list_present(name, acl_type, acl_names=None, perms="", recurse=False, force=False)`

Ensure a Linux ACL list is present

Takes a list of acl names and add them to the given path

name The acl path

acl_type The type of the acl is used for it can be 'user' or 'group'

acl_names The list of users or groups

perms Set the permissions eg.: rwx

recurse Set the permissions recursive in the path

force Wipe out old permissions and ensure only the new permissions are set

`salt.states.linux_acl.present(name, acl_type, acl_name="", perms="", recurse=False, force=False)`

Ensure a Linux ACL is present

name The acl path

acl_type The type of the acl is used for it can be 'user' or 'group'

acl_name The user or group

perms Set the permissions eg.: rwx

recurse Set the permissions recursive in the path
force Wipe out old permissions and ensure only the new permissions are set

21.19.149 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

salt.states.locale.present(*name*)

Generate a locale if it is not present

New in version 2014.7.0.

name The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

salt.states.locale.system(*name*)

Set the locale for the system

name The name of the locale to use

21.19.150 salt.states.logadm module

Management of logs using Solaris logadm.

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.modulus.logadm

platform Oracle Solaris, Sun Solaris, illumos

New in version nitrogen.

```
.. note::
  TODO
```

salt.states.logadm.remove(*name*, *log_file=None*)

Remove a log from the logadm configuration

name [string] entryname

log_file [string] (optional) log file path

Note: If *log_file* is specified it will be used instead of the entry name.

salt.states.logadm.rotate(*name*, ***kwargs*)

Add a log to the logadm configuration

name [string] alias for entryname
kwargs [boolean|string|int] optional additional flags and parameters

21.19.151 salt.states.logrotate module

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.set_(name, key, value, setting=None, conf_file='/etc/logrotate.conf')`

Set a new value for a specific configuration line.

Parameters

- **key** (*str*) – The command or block to configure.
- **value** (*str*) – The command value or command of the block specified by the key parameter.
- **setting** (*str*) – The command value for the command specified by the value parameter.
- **conf_file** (*str*) – The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
  logrotate.set:
    - key: rotate
    - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
  logrotate.set:
    - key: /var/log/wtmp
    - value: rotate
    - setting: 2
    - conf_file: /etc/logrotate.conf
```

21.19.152 salt.states.loop module

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
    - m_args:
      - {{ elb }}
    - m_kwargs:
      keyid: {{ access_key }}
      key: {{ secret_key }}
      instances: "{{{ instance }}"
```

Warning: This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

`salt.states.loop.until`(*name*, *m_args=None*, *m_kwargs=None*, *condition=None*, *period=0*, *timeout=604800*)

Loop over an execution module until a condition is met.

name The name of the execution module

m_args The execution module's positional arguments

m_kwargs The execution module's keyword arguments

condition The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.

period The number of seconds to wait between executions

timeout The timeout in seconds

21.19.153 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```

/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K

```

`salt.states.lvm.lv_absent`(*name*, *vgname=None*)

Remove a given existing Logical Volume from a named existing volume group

name The Logical Volume to remove

vgname The name of the Volume Group on which the Logical Volume resides

`salt.states.lvm.lv_present`(*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=""*, *thinvolume=False*, *thinpool=False*, *force=False*, ***kwargs*)

Create a new Logical Volume

name The name of the Logical Volume

vgname The name of the Volume Group on which the Logical Volume resides

size The initial size of the Logical Volume

extents The number of logical extents to allocate

snapshot The name of the snapshot

pv The Physical Volume to use

kwargs Any supported options to `lvcreate`. See `linux_lvm` for more details.

New in version `to_complete`.

thinvolume Logical Volume is thinly provisioned

thinpool Logical Volume is a thin pool

New in version 2018.3.0.

force Assume yes to all prompts

`salt.states.lvm.pv_absent(name)`
 Ensure that a Physical Device is not being used by lvm
name The device name to initialize.

`salt.states.lvm.pv_present(name, **kwargs)`
 Set a Physical Device to be used as an LVM Physical Volume
name The device name to initialize.
kwargs Any supported options to pvcreate. See *linux_lvm* for more details.

`salt.states.lvm.vg_absent(name)`
 Remove an LVM volume group
name The volume group to remove

`salt.states.lvm.vg_present(name, devices=None, **kwargs)`
 Create an LVM Volume Group
name The Volume Group name to create
devices A list of devices that will be added to the Volume Group
kwargs Any supported options to vgcreate. See *linux_lvm* for more details.

21.19.154 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)`
 Ensure the LVS Real Server in specified service is absent.
name The name of the LVS server.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address The LVS service address.
server_address The LVS real server address.

`salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)`
 Ensure that the named service is present.
name The LVS server name
protocol The service protocol
service_address The LVS service address
server_address The real server address.
packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
weight The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

21.19.155 salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent` (*name*, *protocol=None*, *service_address=None*)

Ensure the LVS service is absent.

name The name of the LVS service

protocol The service protocol

service_address The LVS service address

`salt.states.lvs_service.present` (*name*, *protocol=None*, *service_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

name The LVS service name

protocol The service protocol

service_address The LVS service address

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

```

lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr

```

21.19.156 salt.states.lxc

Manage Linux Containers

`salt.states.lxc.absent` (*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

name Name of the container to destroy

stop stop before destroying default: false

New in version 2015.5.2.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```

web01:
  lxc.absent

```

`salt.states.lxc.edited_conf` (*name*, *lxc_conf=None*, *lxc_conf_unset=None*)

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

Issue #35523 was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```

setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
      - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
      - lxc.utsname

```

`salt.states.lxc.frozen` (*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use `lxc.present`.

name The name of the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

start [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```

web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False

```

`salt.states.lxc.present` (*name*, *running=None*, *clone_from=None*, *snapshot=False*, *profile=None*, *network_profile=None*, *template=None*, *options=None*, *image=None*, *config=None*, *fstype=None*, *size=None*, *backing=None*, *vgname=None*, *lvname=None*, *thinpool=None*, *path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

name The name of the container to be created

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

running [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

clone_from Create named container as a clone of the specified container

snapshot [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

profile Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

network_profile Network Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

options

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to `filesystem` within `/var/lib/lxc`.

fstype Filesystem type to use on LVM logical volume

size Size of the volume to create. Only applicable if `backing` is set to `lvm`.

vgname [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

thinpool Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

salt.states.lxc.running (*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

Note: This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

name The name of the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

restart [`False`] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass(name, **kwargs)`

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.stopped(name, kill=False, path=None)`

Ensure that a container is stopped

Note: This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

name The name of the container

path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

kill [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

21.19.157 salt.states.mac_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osascript:
  assistive.installed:
    - enabled: True
```

`salt.states.mac_assistive.installed(name, enabled=True)`

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

name The bundle ID or path to command

enable Should assistive access be enabled on this application?

21.19.158 salt.states.macdefaults

Writing/reading defaults from a macOS minion

`salt.states.macdefaults.absent`(*name, domain, user=None*)

Make sure the defaults value is absent

name The key of the given domain to remove

domain The name of the domain to remove from

user The user to write the defaults to

`salt.states.macdefaults.write`(*name, domain, value, vtype='string', user=None*)

Write a default to the system

name The key of the given domain to write to

domain The name of the domain to write to

value The value to write to the given key

vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user The user to write the defaults to

21.19.159 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:  
keychain.installed:  
- password: test123
```

`salt.states.mac_keychain.default_keychain`(*name, domain='user', user=None*)

Set the default keychain to use

name The chain in which to use as the default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to run as

`salt.states.mac_keychain.installed`(*name, password, keychain='/Library/Keychains/System.keychain', **kwargs*)

Install a p12 certificate file into the macOS keychain

name The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.uninstalled`(*name, password, keychain='/Library/Keychains/System.keychain', keychain_password=None*)

Uninstall a p12 certificate file from the macOS keychain

name The certificate to uninstall, this can be a path for a .p12 or the friendly name

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

cert_name The friendly name of the certificate, this can be used instead of giving a certificate

keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

21.19.160 salt.states.macpackage

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1\n.*7B91b
```

salt.states.macpackage.installed(*name*, *target*='LocalSystem', *dmg*=False, *store*=False, *app*=False, *mpkg*=False, *user*=None, *onlyif*=None, *unless*=None, *force*=False, *allow_untrusted*=False, *version_check*=None)

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name The pkg or dmg file to install

target The location in which to install the package. This can be a path or LocalSystem

dmg Is the given file a dmg file?

store Should the pkg be installed as if it was from the Mac OS Store?

app Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

user Name of the user performing the unless or onlyif checks

onlyif A command to run as a check, run the named command only if the command passed to the **onlyif** option returns true

unless A command to run as a check, only run the named command if the command passed to the **unless** option returns false

force Force the package to be installed even if its already been found installed

allow_untrusted Allow the installation of untrusted packages

version_check The command and version that we want to check against, the version number can use regex.

```
version_check: python --version_check=2.7.[0-9]
```

21.19.161 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```

/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111

```

`salt.states.mac_xattr.delete`(*name*, *attributes*)

Make sure the given attributes are deleted from the file/directory

name The path to the file/directory

attributes The attributes that should be removed from the file/directory, this is accepted as an array.

`salt.states.mac_xattr.exists`(*name*, *attributes*)

Make sure the given attributes exist on the file/directory

name The path to the file/directory

attributes The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

21.19.162 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's `make.conf` file

```

makeopts:
  makeconf.present:
    - value: '-j3'

```

`salt.states.makeconf.absent`(*name*)

Verify that the variable is not in the `make.conf`.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

`salt.states.makeconf.present`(*name*, *value=None*, *contains=None*, *excludes=None*)

Verify that the variable is in the `make.conf` and has the provided settings. If `value` is set, `contains` and `excludes` will be ignored.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

value Enforce that the value of the variable is set to the provided value

contains Enforce that the value of the variable contains the provided value

excludes Enforce that the value of the variable does not contain the provided value.

21.19.163 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```

my_app:
  marathon_app.config:
    - config:
      cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      cpus: 0.1
      mem: 10
      instances: 3

```

New in version 2015.8.2.

`salt.states.marathon_app.absent(name)`

Ensure that the marathon app with the given id is not present.

Parameters **name** – The app name/id

Returns A standard Salt changes dictionary

`salt.states.marathon_app.config(name, config)`

Ensure that the marathon app with the given id is present and is configured to match the given config values.

Parameters

- **name** – The app name/id

- **config** – The configuration to apply (dict)

Returns A standard Salt changes dictionary

`salt.states.marathon_app.running(name, restart=False, force=True)`

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **name** – The app name/id

- **restart** – Restart the app

- **force** – Override the current deployment

Returns A standard Salt changes dictionary

21.19.164 salt.states.mdadm_raid

Managing software RAID with mdadm

depends mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
raid.present:
- level: 5
- devices:
  - /dev/xvdd
  - /dev/xvde
  - /dev/xvdf
- chunk: 256
- run: True
```

`salt.states.mdadm_raid.absent(name)`

Verify that the raid is absent

name The name of raid device to be destroyed

```
/dev/md0:
raid:
- absent
```

`salt.states.mdadm_raid.present(name, level, devices, **kwargs)`

Verify that the raid is present

Changed in version 2014.7.0.

name The name of raid device to be created

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

kwargs Optional arguments to be passed to mdadm.

Example:

```

/dev/md0:
raid.present:
- level: 5
- devices:
- /dev/xvdd
- /dev/xvde
- /dev/xvdf
- chunk: 256
- run: True

```

21.19.165 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent` (*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

name The key

value [None] If specified, only ensure that the key is absent if it matches the specified value.

host The memcached server IP address

port The memcached server port

```

foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1

```

`salt.states.memcached.managed` (*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Manage a memcached key.

name The key to manage

value The value to set for that key

host The memcached server IP address

port The memcached server port

```

foo:
  memcached.managed:
    - value: bar

```

21.19.166 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated` (*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```

loadbalancer:
  modjk.worker_activated:
    - workers:

```

(continues on next page)

(continued from previous page)

```
- app1
- app2
```

`salt.states.modjk.worker_disabled`(*name*, *workers=None*, *profile='default'*)
Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_recover`(*name*, *workers=None*, *profile='default'*)
Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_stopped`(*name*, *workers=None*, *profile='default'*)
Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

21.19.167 salt.states.modjk_worker

Manage modjk workers

Send commands to a `modjk` load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the `modjk.*` functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the `modjk` execution module *documentation*

`salt.states.modjk_worker.activate`(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.disable`(*name*, *lbn*, *target*, *profile*='default', *tgt_type*='glob')

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.stop`(*name*, *lbn*, *target*, *profile*='default', *tgt_type*='glob')

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions. The worker won't get any traffic from the lbn.

Example:

```
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

21.19.168 salt.states.module

Execution of Salt modules from within states

With `module.run` these states allow individual execution module calls to be made via states. To call a single module function use a `module.run` state:

```
mine.send:
  module.run:
    - network.interfaces
```

Note that this example is probably unnecessary to use in practice, since the `mine_functions` and `mine_interval` config parameters can be used to schedule updates for the mine (see [here](#) for more info).

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```

fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'

```

Another example:

```

mine.send:
  module.run:
    - network.ip_addrs:
    - interface: eth0

```

And more complex example:

```

eventsviewer:
  module.run:
    - task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'

```

Please note, this is a new behaviour of *module.run* function.

With the previous *module.run* there are several differences:

- The need of *name* keyword
- The need of *m_* prefix
- No way to call more than one function at once

For example:

```

mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces

```

All arguments that the *module* state does not consume are passed through to the execution module function being executed:

```

fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'

```

Due to how the state system works, if a module function accepts an argument called, *name*, then *m_name* must be used to specify that argument, to avoid a collision with the *name* argument.

Here is a list of keywords hidden by the state system, which must be prefixed with *m_*:

- fun
- name
- names
- state
- saltenv

For example:

```
disable_nfs:  
module.run:  
- name: service.disable  
- m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:  
module.run:  
- func: network.ip_addrs  
- kwargs:  
  interface: eth0
```

```
cloud.create:  
module.run:  
- func: cloud.create  
- provider: test-provider  
- m_names:  
  - test-vlad  
- kwargs: {  
    ssh_username: 'ubuntu',  
    image: 'ami-8d6d9daa',  
    securitygroup: 'default',  
    size: 'c3.large',  
    location: 'ap-northeast-1',  
    delvol_on_destroy: 'True'  
  }  
}
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```
eventsviewer:  
module.run:  
- name: task.create_task  
- m_name: 'events-viewer'  
- user_name: System  
- kwargs: {  
    action_type: 'Execute',  
    cmd: 'c:\netops\scripts\events_viewer.bat',  
    trigger_type: 'Daily',  
    start_date: '2017-1-20',  
    start_time: '11:59PM'  
  }  
}
```

Another option is to use the new version of *module.run*. With which you can call one (or more!) functions at once the following way:

```

call_something:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'

```

By default this behaviour is not turned on. In order to do so, please add the following configuration to the minion:

```

use_superseded:
  - module.run

```

`salt.states.module.run(**kwargs)`

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

Parameters

- **returner** – Specify a common returner for the whole batch to send the return data
- **kwargs** – Pass any arguments needed to execute the function(s)

```

some_id_of_state:
  module.run:
    - network.ip_addrs:
      - interface: eth0
    - cloud.create:
      - names:
        - test-isbm-1
        - test-isbm-2
      - ssh_username: sles
      - image: sles12sp2
      - securitygroup: default
      - size: 'c3.large'
      - location: ap-northeast-1
      - delvol_on_destroy: True

```

Returns

`salt.states.module.wait(name, **kwargs)`

Run a single module function only if the watch statement calls it

name The module function to execute

****kwargs** Pass any arguments needed to execute the function

Note: Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a *watch requisite*, and the state which it is watching changes.
 2. Another state has a *watch_in requisite* which references this state, and the state with the `watch_in` changes.
-

21.19.169 salt.states.mongodb_database

Management of MongoDB Databases

depends

- pymongo Python module

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`.

`salt.states.mongodb_database.absent` (*name, user=None, password=None, host=None, port=None, authdb=None*)

Ensure that the named database is absent. Note that creation doesn't make sense in MongoDB.

name The name of the database to remove

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

authdb The database in which to authenticate

21.19.170 salt.states.mongodb_user

Management of MongoDB Users

depends

- pymongo Python module

`salt.states.mongodb_user.absent` (*name, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Ensure that the named user is absent

name The name of the user to remove

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified by the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database from which to remove the user specified by the `name` parameter

authdb The database in which to authenticate

`salt.states.mongodb_user.present` (*name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None*)

Ensure that the user is present with the specified properties

name The name of the user to manage

passwd The password of the user to manage

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified with the `user` parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database in which to create the user

Note: If the database doesn't exist, it will be created.

authdb The database in which to authenticate

roles The roles assigned to user specified with the `name` parameter

Example:

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
    - database: admin
    # Connect as admin:sekrit
    - user: admin
```

(continues on next page)

(continued from previous page)

```

- password: sekret
- roles:
  - readWrite
  - userAdmin
  - dbOwner

```

21.19.171 salt.states.monit

Monit state

Manage monit states

```

monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
  monit.unmonitor:
    - name: service

```

Note: Use of these states require that the *monit* execution module is available.

salt.states.monit.monitor(*name*)

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

salt.states.monit.unmonitor(*name*)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

21.19.172 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```

/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2

```

(continues on next page)

(continued from previous page)

```

- persist: True
- mkmnt: True

/var/lib/bigdata:
mount.mounted:
- device: /srv/bigdata
- fstype: none
- opts: bind
- dump: 0
- pass_num: 0
- persist: True
- mkmnt: True

```

`salt.states.mount.mod_watch`(*name*, *user=None*, ***kwargs*)

The mounted watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

name The name of the mount point

```

salt.states.mount.mounted(name, device, fstype, mkmnt=False, opts='defaults',
                           dump=0, pass_num=0, config='/etc/fstab', persist=True,
                           mount=True, user=None, match_on='auto', device_name_regex=None,
                           extra_mount_invisible_options=None, extra_mount_invisible_keys=None,
                           extra_mount_ignore_fs_keys=None, extra_mount_translate_options=None,
                           hidden_opts=None, **kwargs)

```

Verify that a device is mounted

name The path to the location where the device is to be mounted

device The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

fstype The filesystem type, this will be `xf`s, `ext2/3/4` in the case of classic filesystems, `fu`se in the case of fuse mounts, and `nfs` in the case of nfs mounts

mkmnt If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

opts A list object of options or a comma delimited list

dump The dump value to be passed into the fstab, Default is 0

pass_num The pass value to be passed into the fstab, Default is 0

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be saved in the fstab, Default is `True`

mount Set if the mount should be mounted immediately, Default is `True`

user The account used to execute the mount; this defaults to the user salt is running as on the minion

match_on A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on `fstype`. In general, `auto` matches on name for recognized special devices and device otherwise.

device_name_regex A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```

{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:

```

(continues on next page)

(continued from previous page)

```

mount.mounted:
  - name: /mnt/glusterfs_mount_point
  - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
  - fstype: glusterfs
  - opts: _netdev,rw,defaults,direct-io-mode=disable
  - mkmnt: True
  - persist: True
  - dump: 0
  - pass_num: 0
  - device_name_regex:
    - ({{ glusterfs_ip_list|join('|') }}):/volume_name

```

New in version 2016.11.0.

extra_mount_invisible_options A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

extra_mount_invisible_keys A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

extra_mount_ignore_fs_keys A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
  'ramfs': ['size']
}
```

extra_mount_translate_options A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

hidden_opts A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

`salt.states.mount.swap` (*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
mount.swap
```

Note: swap does not currently support LABEL

`salt.states.mount.unmounted`(*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*, ***kwargs*)

New in version 0.17.0.

Verify that a device is not mounted

name The path to the location where the device is to be unmounted from

device The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be purged from the fstab, Default is `False`

user The user to own the mount; this defaults to the user salt is running as on the minion

21.19.173 salt.states.msteams module

Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The `hook_url` can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

`salt.states.msteams.post_card`(*name*, *message*, *hook_url=None*, *title=None*, *theme_color=None*)

Send a message to a Microsoft Teams channel

```
send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

message The message that is to be sent to the MS Teams channel.

The following parameters are optional:

hook_url The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

title The title for the card posted to the channel

theme_color A hex code for the desired highlight color

21.19.174 salt.states.mysql_database

Management of MySQL databases (schemas)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
mysql_database.present
```

`salt.states.mysql_database.absent` (*name*, ****connection_args**)

Ensure that the named database is absent

name The name of the database to remove

`salt.states.mysql_database.present` (*name*, *character_set=None*, *collate=None*, ****connection_args**)

Ensure that the named database is present with the specified properties

name The name of the database to manage

21.19.175 salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a 'priv_level' in the same specification as defined in the MySQL documentation:

- *
- **
- db_name.*
- db_name.tbl_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exampledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
```

(continues on next page)

(continued from previous page)

```
- grant: select
- database: somedb.sometable
- user: joe
```

`salt.states.mysql_grants.absent` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Ensure that the grant is absent

name The name (key) of the grant to add

grant The grant *priv_type* (i.e. select,insert,update OR all privileges)

database The database *priv_level* (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, *revoke_first=False*, *ssl_option=False*, ***connection_args*)

Ensure that the grant is present with the specified properties

name The name (key) of the grant to add

grant The grant *priv_type* (i.e. select,insert,update OR all privileges)

database The database *priv_level* (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

grant_option Adds the WITH GRANT OPTION to the defined grant. Default is `False`

escape Defines if the database value gets escaped or not. Default is `True`

revoke_first By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `'revoke_first'` options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

ssl_option Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

21.19.176 salt.states.mysql_query

Execution of MySQL queries

New in version 2014.7.0.

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```

query_id:
  mysql_query.run
  - database: my_database
  - query:    "SELECT * FROM table;"
  - output:  "/tmp/query_id.txt"

```

`salt.states.mysql_query.run`(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *check_db_exists=True*, ***connection_args*)

Execute an arbitrary query on the specified database

name Used only as an ID

database The name of the database to execute the query on

query The query to execute

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

`salt.states.mysql_query.run_file`(*name*, *database*, *query_file=None*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *saltenv=None*, *check_db_exists=True*, ***connection_args*)

Execute an arbitrary query on the specified database

New in version 2017.7.0.

name Used only as an ID

database The name of the database to execute the `query_file` on

query_file The file of mysql commands to run

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

saltenv: The saltenv to pull the `query_file` from

check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

21.19.177 salt.states.mysql_user

Management of MySQL users

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See [salt.states.mysql_grants](#) for further instructions.

`salt.states.mysql_user.absent` (*name*, *host*='localhost', ***connection_args*)

Ensure that the named user is absent

name The name of the user to remove

`salt.states.mysql_user.present` (*name*, *host*='localhost', *password*=None, *password_hash*=None, *allow_passwordless*=False, *unix_socket*=False, *password_column*=None, ***connection_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

name The name of the user to manage

host Host for which this user/password combo applies

password The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

allow_passwordless If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

unix_socket If `True` and `allow_passwordless` is `True`, the `unix_socket` auth plugin will be used.

21.19.178 salt.states.netacl

Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by [Capirca](#).

New in version 2017.7.0.

```
codeauthor Mircea Ulinic <mircea@cloudflare.com>
maturity new
depends capirca, napalm
platform unix
```

Dependencies

Capirca

To install Capirca, execute: `pip install capirca`.

NAPALM

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

```
salt.states.netacl.filter(name, filter_name, filter_options=None, terms=None, prepend=True,
                          pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False,
                          only_lower_merge=False, revision_id=None, revision_no=None, re-
                          vision_date=True, revision_date_format='%Y/%m/%d', test=False,
                          commit=True, debug=False)
```

Generate and load the configuration of a policy filter.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of [options](#).

terms Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: True When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: acl The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

merge_pillar: False Merge `terms` with the corresponding value from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

only_lower_merge: False Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: True Boolean flag: display the date when the filter configuration was generated. Default: True.

revision_date_format: %Y/%m/%d The date format to be used when generating the performe data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True Commit? Default: True.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:
-----
      ID: my-filter
      Function: netacl.filter
      Result: None
      Comment: Testing mode: Configuration discarded.

Summary for edge01.flw01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    2.437 s
```

Pillar example:

```

acl:
- my-filter:
  options:
  - inet6
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
    - tcp
    - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]
    protocol: tcp
    action: accept

```

State SLS Example:

```

{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key=
↳'firewall') -%}
my_first_filter_state:
  netacl.filter:
  - filter_name: {{ filter_name }}
  - options: {{ my_filter_cfg['options'] | json }}
  - terms: {{ my_filter_cfg['terms'] | json }}
  - revision_date: false
  - revision_no: 5
  - debug: true

```

Or:

```

my_first_filter_state:
  netacl.filter:
  - filter_name: my-filter
  - merge_pillar: true
  - pillar_key: firewall
  - revision_date: false
  - revision_no: 5
  - debug: true

```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (“| json”), instead of relying on the default Python serializer.

`salt.states.netacl.managed`(*name*, *filters=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=False*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*)

Manage the whole firewall configuration.

filters Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: True When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: acl The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

merge_pillar: False Merge the `filters` will the corresponding values from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

only_lower_merge: False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

test: False Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: True Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

commit: True Commit? Default: `True`.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:
-----
      ID: netacl_example
  Function: netacl.managed
    Result: None

```

Summary for edge01.bjm01

 Succeeded: 1 (unchanged=1, changed=1)
 Failed: 0

 Total states run: 1
 Total run time: 5.569 s

The policy configuration has been loaded from the pillar, having the following structure:

```

firewall:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
    - tcp
    - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]
    protocol: tcp
    action: accept
- block-icmp:
  terms:
  - first-term:
    protocol:
    - icmp
    action: reject

```

Example SLS file:

```

{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true

```

Or:

```

netacl_example:
  netacl.managed:
  - pillar_key: firewall
  - merge_pillar: true
  - revision_no: 2
  - debug: true

```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (“| json”), instead of relying on the default Python serializer.

```

salt.states.netacl.term(name, filter_name, term_name, filter_options=None, pillar_key='acl',
pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None,
revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d',
test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)

```

Manage the configuration of a specific policy term.

filter_name The name of the policy filter.

term_name The name of the term.

filter_options Additional filter options. These options are platform-specific. See the complete list of [options](#).

pillar_key: acl The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

merge_pillar: False Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.

revision_id Add a comment in the term config having the description for the changes applied.

revision_no The revision count.

revision_date: True Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: False Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True Commit? Default: `True`.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and `protocol`.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the [file state](#).

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and `protocol`. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

Note: The following fields are accepted:

- `action`
- `address`
- `address_exclude`
- `comment`
- `counter`
- `expiration`
- `destination_address`
- `destination_address_exclude`
- `destination_port`
- `destination_prefix`
- `forwarding_class`
- `forwarding_class_except`
- `logging`
- `log_name`
- `loss_priority`
- `option`
- `policer`
- `port`
- `precedence`
- `principals`
- `protocol`

- protocol_except
 - qos
 - pan_application
 - routing_instance
 - source_address
 - source_address_exclude
 - source_port
 - source_prefix
 - verbatim
 - packet_length
 - fragment_offset
 - hop_limit
 - icmp_type
 - ether_type
 - traffic_class_count
 - traffic_type
 - translated
 - dscp_set
 - dscp_match
 - dscp_except
 - next_ip
 - flexible_match_range
 - source_prefix_except
 - destination_prefix_except
 - vpn
 - source_tag
 - destination_tag
 - source_interface
 - destination_interface
 - flattened
 - flattened_addr
 - flattened_saddr
 - flattened_daddr
 - priority
-

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol

- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:  
- 172.17.17.1/24  
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:  
- ntp  
- snmp  
- ldap  
- bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:  
- [1000, 2000]  
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```

edge01.bjm01:
-----
      ID: update_icmp_first_term
  Function: netacl.term
     Result: None
  Comment: Testing mode: Configuration discarded.
  Started: 12:49:09.174179
  Duration: 5751.882 ms
  Changes:
  -----
    diff:
      [edit firewall]
      +   family inet {
      +     /*
      +       ** $Id: update_icmp_first_term $
      +       ** $Date: 2017/02/30 $
      +       **
      +     */
      +     filter block-icmp {
      +       term first-term {
      +         from {
      +           protocol icmp;
      +         }
      +         then {
      +           reject;
      +         }
      +       }
      +     }
      +   }

Summary for edge01.bjm01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    5.752 s

```

Pillar example:

```

firewall:
  - block-icmp:
    terms:
      - first-term:
        protocol:
          - icmp
        action: reject

```

State SLS example:

```

{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}

```

(continues on next page)

(continued from previous page)

```

- filter_options:
  - not-interface-specific
- term_name: {{ term_name }}
- {{ my_term_cfg | json }}

```

Or directly referencing the pillar keys:

```

update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
      - not-interface-specific
    - term_name: first-term
    - merge_pillar: true

```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (“| json”), instead of relying on the default Python serializer.

21.19.179 salt.states.netconfig

Network Config

Manage the configuration on a network device given a specific static config or template.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

salt.states.netconfig.commit_cancelled(*name*)

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_cancelled
```

`salt.states.netconfig.commit_confirmed`(*name*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_confirmed
```

`salt.states.netconfig.managed`(*name*, *template_name*=None, *template_source*=None, *template_hash*=None, *template_hash_name*=None, *saltenv*='base', *template_engine*='jinja', *skip_verify*=False, *context*=None, *defaults*=None, *test*=False, *commit*=True, *debug*=False, *replace*=False, *commit_in*=None, *commit_at*=None, *revert_in*=None, *revert_at*=None, ***template_vars*)

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

template_name Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

template_source: None Inline config template to be rendered and loaded on the device.

template_hash: None Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

template_hash_name: `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

saltenv: `base` Specifies the template environment. This will influence the relative imports inside the templates.

template_engine: `jinja` The following templates engines are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

skip_verify: `False` If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

test: `False` Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` (will commit the changes on the device).

commit: `True` Commit? Default: `True`.

debug: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

Note: This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the `state.sls` or `state.apply` (see below for an example).

commit_in: `None` Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: `None` Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you

have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: None Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: None Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

replace: `False` Load and replace the configuration. Default: `False` (will apply load merge).

context: `None` Overrides default context variables passed to the template.

New in version 2019.2.0.

defaults: `None` Default variables/context passed to the template.

template_vars Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

Note: It is more recommended to use the `context` argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under `salt://router/config.sls`):

```

whole_config_example:
  netconfig.managed:
    - template_name: salt://path/to/complete_config.jinja
    - debug: True
    - replace: True
bgp_config_example:
  netconfig.managed:
    - template_name: /absolute/path/to/bgp_neighbors.mako
    - template_engine: mako
prefix_lists_example:
  netconfig.managed:
    - template_name: prefix_lists.cheetah
    - debug: True
    - template_engine: cheetah
ntp_peers_example:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - skip_verify: False
    - debug: True
    - peers:
      - 192.168.0.1
      - 192.168.0.1
ntp_peers_example_using_pillar:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - peers: {{ pillar.get('ntp.peers', []) }}
  
```

Multi template example:

```

hostname_and_ntp:
  netconfig.managed:
    - template_name:
      - https://bit.ly/20hSgqP
      - https://bit.ly/2M6C4Lx
      - https://bit.ly/20IWVTs
    - debug: true
    - context:
      hostname: {{ opts.id }}
      servers:
        - 172.17.17.1
        - 172.17.17.2
  
```

(continues on next page)

(continued from previous page)

```
peers:
- 192.168.0.1
- 192.168.0.2
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
$ sudo salt -N all-routers state.sls router.config pillar="{ 'debug': True }"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
-----
      ID: ntp_peers_example_using_pillar
  Function: netconfig.managed
     Result: None
   Comment: Testing mode: Configuration discarded.
  Started: 12:01:40.744535
 Duration: 8755.788 ms
  Changes:
    -----
    diff:
      [edit system ntp]
          peer 192.168.0.1 { ... }
      +   peer 172.17.17.1;
      +   peer 172.17.17.3;

Summary for juniper.device
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    8.756 s
```

Raw output example (useful when the output is reused in other states/execution modules):

```
$ sudo salt --out=pprint 'juniper.device' state.sls router.config test=True
↳ debug=True
```

```
{
  'juniper.device': {
    'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_using_
↳ pillar_|-managed': {
      '__id__': 'ntp_peers_example_using_pillar',
      '__run_num__': 0,
      'already_configured': False,
      'changes': {
        'diff': '[edit system ntp]  peer 192.168.0.1 { ... }+  peer 172.
↳ 17.17.1;+  peer 172.17.17.3;'
```

(continues on next page)

(continued from previous page)

```

    },
    'comment': 'Testing mode: Configuration discarded.',
    'duration': 7400.759,
    'loaded_config': 'system { ntp { peer 172.17.17.1; peer 172.17.17.
↪3; } }',
    'name': 'ntp_peers_example_using_pillar',
    'result': None,
    'start_time': '12:09:09.811445'
  }
}
}

```

```

salt.states.netconfig.replace_pattern(name, pattern, repl, count=0, flags=8,
                                     bufsize=1, append_if_not_found=False,
                                     prepend_if_not_found=False,
                                     not_found_content=None, search_only=False,
                                     show_changes=True, backslash_literal=False,
                                     source='running', path=None, test=False, replace=True,
                                     debug=False, commit=True)

```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

pattern A regular expression, to be matched using Python's `search()`.

repl The replacement text.

count: **0** Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): **8** A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): **1** How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: **False** If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: **False** If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

search_only: **False** If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: **True** If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

backslash_literal: **False** Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

source: **running** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path Save the temporary configuration to a specific path, then read from there.

test: **False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit the configuration changes? Default: `True`.

debug: False Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: True Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```
update_policy_name:
  netconfig.replace_pattern:
    - pattern: OLD-POLICY-NAME
    - repl: new-policy-name
    - debug: true
```

```
salt.states.netconfig.saved(name, source='running', user=None, group=None, mode=None,
                             attrs=None, makedirs=False, dir_mode=None, replace=True,
                             backup="", show_changes=True, create=True, tmp_dir="", tmp_ext="",
                             encoding=None, encoding_errors='strict', allow_empty=False,
                             follow_symlinks=True, check_cmd=None, win_owner=None,
                             win_perms=None, win_deny_perms=None, win_inheritance=True,
                             win_perms_reset=False, **kwargs)
```

New in version 2019.2.0.

Save the configuration to a file on the local file system.

name Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

source: running The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`. The default mode for new files and directories corresponds to the `umask` of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

attrs The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

makedirs: False If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds `umask` of salt process. For existing files and directories it's not enforced.

replace: True If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

backup Overrides the default backup mode for this specific file. See [backup_mode documentation](#) for more details.

show_changes: True Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create: True If set to `False`, then the file will only be managed if the file already exists on the system.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

encoding_errors: 'strict' Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

allow_empty: True If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks: True If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

tmp_dir Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

tmp_ext Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` `upstart` config checker).

win_owner: None The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

win_perms: None A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_deny_perms: None A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_inheritance: True True to inherit permissions from the parent directory, False not to inherit permission.

win_perms_reset: False If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is `False`.

State SLS Example:

```
/var/backups/{{ opts.id }}/{{ salt.status.time('%s') }}.cfg:
  netconfig.saved:
    - source: running
    - makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion `core1.lon01`, the configuration would be saved in the file: `/var/backups/core01.lon01/1533316558.cfg`

21.19.180 salt.states.netntp

Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

```
codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix
```

Dependencies

- Requires `netaddr` to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: `pip install dnspython` to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- *NAPALM proxy minion*
- *NTP operational and configuration management module*

`salt.states.netntp.managed`(*name, peers=None, servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36
```

Output example:

```
{
  'edge01.nrt04': {
    'netntp_|-netntp_example_|-netntp_example_|-managed': {
      'comment': 'NTP servers already configured as needed.',
      'name': 'netntp_example',
      'start_time': '12:45:24.056659',
      'duration': 2938.857,
      'changes': {
        'peers': {
          'removed': [
            '192.168.0.2',
            '192.168.0.3'
          ],
          'added': [
            '192.168.0.1',
            '172.17.17.1'
          ]
        }
      },
      'result': None
    }
  }
}
```

21.19.181 salt.states.netsnmp

Network SNMP

Manage the SNMP configuration on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm snmp management module (salt.modules.napalm_snmp)*

salt.states.netsnmp.managed(*name, config=None, defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
  netsnmp.managed:
    - config:
      location: Honolulu, HI, US
    - defaults:
      contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
-----
      ID: snmp_example
  Function: snmp.managed
     Result: None
  Comment: Testing mode: configuration was not changed!
  Started: 13:29:06.872363
  Duration: 920.466 ms
  Changes:
  -----
    added:
  -----
      chassis_id:
         None
      contact:
         noc@cloudflare.com
      location:
         Honolulu, HI, US

Summary for edge01.hnl01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0

Total run time: 920.466 ms
```

21.19.182 salt.states.netusers

Network Users

Manage the users configuration on network devices via the NAPALM proxy.

```
codeauthor Mircea Ulinic <mircea@cloudflare.com>
maturity new
depends napalm
platform unix
```

Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

`salt.states.netusers.managed` (*name, users=None, defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
  netusers.managed:
    - users:
      admin:
        level: 15
        password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
        sshkeys: []
      restricted:
        level: 1
        password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
      martin:
        level: 15
        password: ''

21.19.183 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: `ipaddr_start`, and `ipaddr_end`.

Other platforms are not yet supported.

Note: On Debian-based systems, networking configuration can be specified in `/etc/network/interfaces` or via included files such as (by default) `/etc/network/interfaces.d/*`. This can be problematic for configuration management. It is recommended to use either `file.managed` or `network.managed`.

If using `network.managed`, it can be useful to ensure `interfaces.d/` is empty. This can be done using:

```
/etc/network/interfaces.d:
```

```
file.directory:
```

- `clean: True`
-

```
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:

    - enable_ipv6: true

.. note::
    Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

.. note::
```

(continues on next page)

(continued from previous page)

```
Use `retain_settings` to retain current network settings that are not otherwise specified in the state. Particularly useful if only setting the hostname. Default behavior is to delete unspecified network settings.
```

```
.. versionadded:: 2016.11.0
```

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

salt.states.network.managed(*name, type, enabled=True, **kwargs*)

Ensure that the named interface is configured properly.

name The name of the interface to manage

type Type of interface and configuration.

enabled Designates the state of this interface.

kwargs The IP parameters for this interface.

salt.states.network.routes(*name, **kwargs*)

Manage network interface static routes.

name Interface name to apply the route to.

kwargs Named routes

salt.states.network.system(*name, **kwargs*)

Ensure that global network settings are configured properly.

name Custom name to represent this configuration change.

kwargs The global parameters for the system.

21.19.184 salt.states.net_napalm_yang

NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

salt.states.net_napalm_yang.configured(*name, data, **kwargs*)

Configure the network device, given the input data structured according to the YANG models.

Note: The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than

the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

data YANG structured data.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: False Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True Commit? Default: `True`.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: False Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

`salt.states.net_napalm_yang.managed`(*name, data, **kwargs*)

Manage the device configuration given the input data structured according to the YANG models.

data YANG structured data.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

compliance_report: False Return the compliance report in the comment.

New in version 2017.7.3.

test: False Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True Commit? Default: `True`.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: False Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

21.19.185 salt.states.neutron_network

Management of OpenStack Neutron Networks

New in version 2018.3.0.

depends shade

configuration see *salt.modules.neutronng* for setup instructions

Example States

```
create network:
  neutron_network.present:
    - name: network1

delete network:
  neutron_network.absent:
    - name: network1

create network with optional params:
  neutron_network.present:
    - name: network1
    - vlan: 200
    - shared: False
    - external: False
    - project: project1
```

`salt.states.neutron_network.absent`(*name*, *auth=None*, ***kwargs*)

Ensure a network does not exist

name Name of the network

`salt.states.neutron_network.present`(*name*, *auth=None*, ***kwargs*)

Ensure a network exists and is up-to-date

name Name of the network

provider A dict of network provider options.
shared Set the network as shared.
external Whether this network is externally accessible.
admin_state_up Set the network administrative state to up.
vlan Vlan ID. Alias for provider

- **physical_network**: provider
- **network_type**: vlan
- **segmentation_id**: (vlan id)

21.19.186 salt.states.neutron_secgroup

Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

depends shade

configuration see *salt.modules.neutronng* for setup instructions

Example States

```
create security group;
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"

delete security group:
neutron_secgroup.absent:
- name_or_id: security_group1
- project_name: Project1

create security group with optional params:
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_name: Project1
```

`salt.states.neutron_secgroup.absent`(*name*, *auth=None*, ***kwargs*)

Ensure a security group does not exist

name Name of the security group

`salt.states.neutron_secgroup.present`(*name*, *auth=None*, ***kwargs*)

Ensure a security group exists.

You can supply either `project_name` or `project_id`.

Creating a default security group will not show up as a change; it gets created through the lookup process.

name Name of the security group

description Description of the security group

project_name Name of Project

project_id ID of Project

21.19.187 salt.states.neutron_secgroup_rule

Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

depends shade

configuration see *salt.modules.neutronng* for setup instructions

Example States

```
create security group rule:
  neutron_secgroup_rule.present:
    - name: security_group1
    - project_name: Project1
    - protocol: icmp

delete security group:
  neutron_secgroup_rule.absent:
    - name_or_id: security_group1

create security group with optional params:
  neutron_secgroup_rule.present:
    - name: security_group1
    - description: "Very Secure Security Group"
    - project_id: 1dcac318a83b4610b7a7f7ba01465548
```

salt.states.neutron_secgroup_rule.absent(*name, auth=None, **kwargs*)

Ensure a security group rule does not exist

name name or id of the security group rule to delete

rule_id uuid of the rule to delete

project_id id of project to delete rule from

salt.states.neutron_secgroup_rule.present(*name, auth=None, **kwargs*)

Ensure a security group rule exists

defaults: **port_range_min=None, port_range_max=None, protocol=None, remote_ip_prefix=None, remote_group_id=None, direction='ingress', ethertype='IPv4', project_id=None**

name Name of the security group to associate with this rule

project_name Name of the project associated with the security group

protocol The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

21.19.188 salt.states.neutron_subnet

Management of OpenStack Neutron Subnets

New in version 2018.3.0.

depends shade

configuration see *salt.modules.neutronng* for setup instructions

Example States

```
create subnet:
  neutron_subnet.present:
    - name: subnet1
```

(continues on next page)

(continued from previous page)

- **network_name_or_id:** network1
- **cidr:** 192.168.199.0/24

delete subnet:**neutron_subnet.absent:**

- **name:** subnet2

create subnet with optional params:**neutron_subnet.present:**

- **name:** subnet1
- **network_name_or_id:** network1
- **enable_dhcp:** True
- **cidr:** 192.168.199.0/24
- **allocation_pools:**
 - **start:** 192.168.199.5
 - **end:** 192.168.199.250
- **host_routes:**
 - **destination:** 192.168..0.0/24
 - **nexthop:** 192.168.0.1
- **gateway_ip:** 192.168.199.1
- **dns_nameservers:**
 - 8.8.8.8
 - 8.8.8.7

create ipv6 subnet:**neutron_subnet.present:**

- **name:** v6subnet1
- **network_name_or_id:** network1
- **ip_version:** 6

salt.states.neutron_subnet.absent (*name, auth=None*)

Ensure a subnet does not exists

name Name of the subnet**salt.states.neutron_subnet.present** (*name, auth=None, **kwargs*)

Ensure a subnet exists and is up-to-date

name Name of the subnet**network_name_or_id** The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.**allocation_pools** A list of dictionaries of the start and end addresses for the allocation pools**gateway_ip** The gateway IP address.**dns_nameservers** A list of DNS name servers for the subnet.**host_routes** A list of host route dictionaries for the subnet.**ipv6_ra_mode** IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.**ipv6_address_mode** IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

21.19.189 salt.states.nfs_export

Management of NFS exports

New in version 2018.3.0.

To ensure an NFS export exists:

```

add_simple_export:
  nfs_export.present:
    - name: '/srv/nfs'
    - hosts: '10.0.2.0/24'
    - options:
      - 'rw'

```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

```

add_complex_export:
  nfs_export.present:
    - name: '/srv/nfs'
    - clients:
      # First export, same as simple one above
      - hosts: '10.0.2.0/24'
        options:
          - 'rw'
      # Second export
      - hosts: '*.example.com'
        options:
          - 'ro'
          - 'subtree_check'

```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```

Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

```

delete_export:
  nfs_export.absent:
    - name: '/srv/nfs'

```

`salt.states.nfs_export.absent` (*name*, *exports='/etc/exports'*)

Ensure that the named path is not exported

name The export path to remove

`salt.states.nfs_export.present` (*name*, *clients=None*, *hosts=None*, *options=None*, *exports='/etc/exports'*)

Ensure that the named export is present with the given options

name The export path to configure

clients A list of hosts and the options applied to them. This option may not be used in combination with the 'hosts' or 'options' shortcuts.

```

- clients:
  # First export
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  # Second export
  - hosts: '*.example.com'

```

(continues on next page)

(continued from previous page)

```

options:
- 'ro'
- 'subtree_check'

```

hosts A string matching a number of hosts, for example:

```

hosts: '10.0.2.123'

hosts: '10.0.2.0/24'

hosts: 'minion1.example.com'

hosts: '*.example.com'

hosts: '*'

```

options A list of NFS options, for example:

```

options:
- 'rw'
- 'subtree_check'

```

21.19.190 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```

httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

```

(continues on next page)

(continued from previous page)

```
httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.delete:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

```
httpd:
  nftables.delete:
    - table: filter
    - family: ipv6
```

(continues on next page)

(continued from previous page)

```

- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

output:**nftables.chain_present:**

```

- family: ip
- table: filter

```

output:**nftables.chain_absent:**

```

- family: ip
- table: filter

```

salt.states.nftables.append(*name*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Append a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *-state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.chain_absent(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.7.0.

Verify the chain is absent.

family Networking family, either ipv4 or ipv6

salt.states.nftables.chain_present(*name*, *table='filter'*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

salt.states.nftables.delete(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *-state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.flush(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Flush current nftables state

family Networking family, either ipv4 or ipv6

`salt.states.nftables.insert`(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either `ipv4` or `ipv6`

All other arguments are passed in with the same name as the long option that would normally be used for `nftables`, with one exception: `-state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

21.19.191 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for `node.js` using the Node Package Manager (`npm`). Note that `npm` must be installed for these states to be available, so `npm` states should include a requisite to a `pkg.installed` state for the package which provides `npm` (simply `npm` in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

`salt.states.npm.bootstrap`(*name*, *user=None*, *silent=True*)

Bootstraps a `node.js` application.

Will execute `'npm install -json'` on the specified directory.

user The user to run NPM with

New in version 0.17.0.

`salt.states.npm.cache_cleaned`(*name=None*, *user=None*, *force=False*)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or `None` for all packages

user The user to run NPM with

force Force cleaning of cache. Required for `npm@5` and greater

New in version 2016.11.6.

`salt.states.npm.installed`(*name*, *pkgs=None*, *dir=None*, *user=None*, *force_reinstall=False*, *registry=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the `name` argument

New in version 2014.7.0.

dir The target directory in which to install the package, or `None` for global installation

user The user to run NPM with

New in version 0.17.0.

registry The NPM registry from which to install the package

New in version 2014.7.0.

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

force_reinstall Install the package even if it is already installed

`salt.states.npm.removed` (*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

dir The target directory in which to install the package, or `None` for global installation

user The user to run NPM with

New in version 0.17.0.

21.19.192 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.managed` (*name*, *servers=None*)

Manage NTP servers

servers A list of NTP servers

21.19.193 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

`salt.states.nxos.config_absent` (*name*)

Ensure a specific configuration line does not exist in the running config

name config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
```

(continues on next page)

(continued from previous page)

```
- snmp-server community randoSNMPstringHERE group network-operator
- snmp-server community AnotherRandomSNMPString group network-admin
```

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

`salt.states.nxos.config_present`(*name*)

Ensure a specific configuration line exists in the running config

name config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw
```

`salt.states.nxos.replace`(*name*, *repl*, *full_match=False*)

Replace all instances of a string or full line in the running config

name String to replace

repl The replacement text

full_match Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, * is added around *name* for matching in the `show run` config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

Note: The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

`salt.states.nxos.user_absent`(*name*)

Ensure a user is not present

name username to remove if it exists

Examples:

```

delete:
  nxos.user_absent:
    - name: daniel

```

`salt.states.nxos.user_present` (*name*, *password=None*, *roles=None*, *encrypted=False*, *crypt_salt=None*, *algorithm='sha256'*)

Ensure a user is present with the specified groups

name Name of user

password Encrypted or Plain Text password for user

roles List of roles the user should be assigned. Any roles not in this list will be removed

encrypted Whether the password is encrypted already or not. Defaults to False

crypt_salt Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

algorithm Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```

create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin

```

21.19.194 salt.states.openstack_config

Manage OpenStack configuration file settings.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

`salt.states.openstack_config.absent` (*name*, *filename*, *section*, *parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

filename The full path to the configuration file

section The section in which the parameter will be set

parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.present` (*name, filename, section, value, parameter=None*)
Ensure a value is set in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
value The value to set

21.19.195 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.absent` (*name*)
Ensures that the named bridge does not exist, eventually deletes it.
Parameters **name** – The name of the bridge.

`salt.states.openvswitch_bridge.present` (*name*)
Ensures that the named bridge exists, eventually creates it.
Parameters **name** – The name of the bridge.

21.19.196 salt.states.openvswitch_port module

Management of Open vSwitch ports.

`salt.states.openvswitch_port.absent` (*name, bridge=None*)
Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.
Parameters

- **name** – The name of the port.
- **bridge** – The name of the bridge.

`salt.states.openvswitch_port.present` (*name, bridge, tunnel_type=None, id=None, remote=None, dst_port=None, internal=False*)
Ensures that the named port exists on bridge, eventually creates it.
Parameters

- **name** – The name of the port.
- **bridge** – The name of the bridge.
- **tunnel_type** – Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** – Optional tunnel's key.
- **remote** – Remote endpoint's IP address.
- **dst_port** – Port to use when creating tunnelport in the switch.
- **internal** – Create an internal port if one does not exist

21.19.197 salt.states.opsgenie

Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

```

used_space:
  disk.status:
    - name: /
    - maximum: 79%
    - minimum: 20%

opsgenie_create_action_sender:
  opsgenie.create_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - reason: 'Disk capacity is out of designated range.'
    - name: disk.status
    - onfail:
      - disk: used_space

opsgenie_close_action_sender:
  opsgenie.close_alert:
    - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
    - name: disk.status
    - require:
      - disk: used_space

```

`salt.states.opsgenie.close_alert` (*name=None, api_key=None, reason='Conditions are met.', action_type='Close'*)

Close an alert in OpsGenie. It's a wrapper function for `create_alert`. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

name It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:

api_key It's the API Key you've copied while adding integration in OpsGenie.

reason It will be used as alert's default message in OpsGenie.

action_type OpsGenie supports the default values Create/Close for `action_type`. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

`salt.states.opsgenie.create_alert` (*name=None, api_key=None, reason=None, action_type='Create'*)

Create an alert in OpsGenie. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

api_key It's the API Key you've copied while adding integration in OpsGenie.

reason It will be used as alert's default message in OpsGenie.

Optional Parameters:

name It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

action_type OpsGenie supports the default values Create/Close for `action_type`. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

21.19.198 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```

server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account

```

`salt.states.pagerduty.create_event` (*name, details, service_key, profile*)
Create an event on the PagerDuty service

```

server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account

```

The following parameters are required:

name This is a short description of the event.

details This can be a more detailed description of the event.

service_key This key can be found by using `pagerduty.list_services`.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

21.19.199 salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```

ensure test escalation policy:
  pagerduty_escalation_policy.present:
    - name: bruce test escalation policy
    - escalation_rules:
      - targets:
        - type: schedule
          id: 'bruce test schedule level1'
        - type: user
          id: 'Bruce Sherrrod'
          escalation_delay_in_minutes: 15
      - targets:
        - type: schedule
          id: 'bruce test schedule level2'
          escalation_delay_in_minutes: 15
      - targets:
        - type: user
          id: 'Bruce TestUser1'
        - type: user
          id: 'Bruce TestUser2'
        - type: user
          id: 'Bruce TestUser3'
        - type: user
          id: 'bruce+test4@lyft.com'
          escalation_delay_in_minutes: 15

```

`salt.states.pagerduty_escalation_policy.absent` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that `pagerduty_escalation_policy.present` accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```
pagerduty_escalation_policy.present:
```

- name: bruce test escalation policy
- escalation_rules:
 - targets:
 - * type: schedule id: 'bruce test schedule level1'
 - * type: user id: 'Bruce Sherrod'

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

21.19.200 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
  pagerduty_schedule.present:
    - name: 'bruce test schedule level1'
    - schedule:
      name: 'bruce test schedule level1'
      time_zone: 'Pacific Time (US & Canada)'
      schedule_layers:
        - name: 'Schedule Layer 1'
          start: '2015-01-01T00:00:00'
          users:
            - user:
                'id': 'Bruce TestUser1'
                member_order: 1
            - user:
                'id': 'Bruce TestUser2'
                member_order: 2
            - user:
                'id': 'bruce+test3@lyft.com'
                member_order: 3
            - user:
                'id': 'bruce+test4@lyft.com'
                member_order: 4
          rotation_virtual_start: '2015-01-01T00:00:00'
          priority: 1
          rotation_turn_length_seconds: 604800
```

`salt.states.pagerduty_schedule.absent` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

`salt.states.pagerduty_schedule.present` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called "schedule."

User id's can be pagerduty id, or name, or email address.

21.19.201 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by name.

For example:

```
ensure test service
  pagerduty_service.present:
    - name: 'my service'
    - escalation_policy_id: 'my escalation policy'
    - type: nagios
```

`salt.states.pagerduty_service.absent` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.present` (*profile='pagerduty', subdomain=None, api_key=None, **kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
  pagerduty_service.present:
    - name: my email service
    - service:
      description: "email service controlled by salt"
      escalation_policy_id: "my escalation policy"
      type: "generic_email"
      service_key: "test-email"
```

```
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
  pagerduty_service.present:
    - name: my cloudwatch service
    - service:
      escalation_policy_id: "my escalation policy"
      type: aws_cloudwatch
      description: "my cloudwatch service controlled by salt"
```

21.19.202 salt.states.pagerduty_user

Manage PagerDuty users.

Example

ensure bruce test user 1:

pagerduty.user_present:

- name: 'Bruce TestUser1'
- email: bruce+test1@lyft.com
- requester_id: P1GV5NT

salt.states.pagerduty_user.**absent**(profile='pagerduty', subdomain=None, api_key=None, ***kwargs*)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.**present**(profile='pagerduty', subdomain=None, api_key=None, ***kwargs*)

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

21.19.203 salt.states.panos

A state module to manage Palo Alto network devices.

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>

maturity new

depends none

platform unix

About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

```

panos/takelock:
  panos.add_config_lock
panos/service_tcp_22:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
↪entry[@name='vsys1']/service
    - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></protocol>
↪</entry>

```

(continues on next page)

(continued from previous page)

```

    - commit: False
panos/create_rule1:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
    ↪entry[@name='vsys1']/rulebase/security/rules
    - value: '
      <entry name="rule1">
        <from><member>trust</member></from>
        <to><member>untrust</member></to>
        <source><member>10.0.0.1</member></source>
        <destination><member>10.0.1.1</member></destination>
        <service><member>tcp-22</member></service>
        <application><member>any</member></application>
        <action>allow</action>
        <disabled>no</disabled>
      </entry>'
    - commit: False
panos/moveruletop:
  panos.move_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
    ↪entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
    - where: top
    - commit: False
panos/removelock:
  panos.remove_config_lock
panos/commit:
  panos.commit

```

Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is_required_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is_required_version']('7.0.0') would match both 7.1.0 and 8.0.0.

```

{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system/
    ↪motd-and-banner
    - value: |
      <banner-header>BANNER TEXT</banner-header>
      <banner-header-color>color2</banner-header-color>
      <banner-header-text-color>color18</banner-header-text-color>
      <banner-header-footer-match>yes</banner-header-footer-match>
    - commit: False
{% endif %}

```

See also:

Palo Alto Proxy Module

salt.states.panos.add_config_lock(*name*)

Prevent other users from changing configuration until the lock is released.

name: The name of the module function to execute.

SLS Example:

```
panos/takelock:
  panos.add_config_lock
```

```
salt.states.panos.address_exists(name, addressname=None, vsys=1, ipnetmask=None,
                                iprange=None, fqdn=None, description=None, commit=False)
```

Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

name: The name of the module function to execute.

addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip_address/mask or ip_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.

iprange(str): A range of addresses using the format ip_address-ip_address where both addresses can be IPv4 or both can be IPv6.

fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/address/h-10.10.10.10:
  panos.address_exists:
    - addressname: h-10.10.10.10
    - vsys: 1
    - ipnetmask: 10.10.10.10
    - commit: False

panos/address/10.0.0.1-10.0.0.50:
  panos.address_exists:
    - addressname: r-10.0.0.1-10.0.0.50
    - vsys: 1
    - iprange: 10.0.0.1-10.0.0.50
    - commit: False

panos/address/foo.bar.com:
  panos.address_exists:
    - addressname: foo.bar.com
    - vsys: 1
```

(continues on next page)

(continued from previous page)

```

- fqdn: foo.bar.com
- description: My fqdn object
- commit: False

```

`salt.states.panos.address_group_exists` (*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the address group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/address-group/my-group:
  panos.address_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - my-address-object
      - my-other-address-group
    - description: A group that needs to exist
    - commit: False

```

`salt.states.panos.clone_config` (*name*, *xpath=None*, *newname=None*, *commit=False*)

Clone a specific XPATH and set it to a new name.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to clone.

newname(str): The new name of the XPATH clone.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/clonerule:
  panos.clone_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
    ↪rules&from=/config/devices/
    entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
    - value: rule2
    - commit: True

```

`salt.states.panos.commit_config(name)`

Commits the candidate configuration to the running configuration.

name: The name of the module function to execute.

SLS Example:

```
panos/commit:
  panos.commit_config
```

`salt.states.panos.delete_config(name, xpath=None, commit=False)`

Deletes a Palo Alto XPATH to a specific value.

Use the xpath parameter to specify the location of the object to be deleted.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/deletegroup:
  panos.delete_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
      ↪entry[@name='test']
    - commit: True
```

`salt.states.panos.download_software(name, version=None, synch=False, check=False)`

Ensures that a software version is downloaded.

name: The name of the module function to execute.

version(str): The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.

synch(bool): If true, after downloading the file it will be synched to its peer.

check(bool): If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.

SLS Example:

```
panos/version8.0.0:
  panos.download_software:
    - version: 8.0.0
    - synch: False
    - check: True
```

`salt.states.panos.edit_config(name, xpath=None, value=None, commit=False)`

Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can replace an existing object hierarchy at a specified location in the configuration with a new value. Use the xpath parameter to specify the location of the object, including the node to be replaced.

This is the recommended state to enforce configurations on a xpath.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to edit. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/addressgroup:
  panos.edit_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
      ↪entry[@name='test']
    - value: <static><entry name='test'><member>abc</member><member>xyz</member>
      ↪</entry></static>
    - commit: True
```

`salt.states.panos.move_config`(*name*, *xpath=None*, *where=None*, *dst=None*, *commit=False*)

Moves a XPATH value to a new location.

Use the *xpath* parameter to specify the location of the object to be moved, the *where* parameter to specify type of move, and *dst* parameter to specify the destination path.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to move.

where(str): The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the *dst* option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The bottom action will move the XPATH to the bottom of its structure.

dst(str): Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

commit(bool): If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:

```
panos/moveruletop:
  panos.move_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
      ↪rules/entry[@name='rule1']
    - where: top
    - commit: True

panos/moveruleafter:
  panos.move_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
      ↪rules/entry[@name='rule1']
    - where: after
    - dst: rule2
    - commit: True
```

`salt.states.panos.remove_config_lock`(*name*)

Release config lock previously held.

name: The name of the module function to execute.

SLS Example:

```
panos/takelock:
  panos.remove_config_lock
```

`salt.states.panos.rename_config`(*name*, *xpath=None*, *newname=None*, *commit=False*)

Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

newname(str): The new name of the XPATH value.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/renamegroup:
  panos.rename_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address/
      ↪entry[@name='old_address']
    - value: new_address
    - commit: True
```

```
salt.states.panos.security_rule_exists(name, rulename=None, vsys='1', action=None,
disabled=None, sourcezone=None, destinationzone=None, source=None, destination=None, application=None, service=None, description=None, logsetting=None, logstart=None, logend=None, negatesource=None, negatedestination=None, profilegroup=None, datafilter=None, fileblock=None, spyware=None, urlfilter=None, virus=None, vulnerability=None, wildfire=None, move=None, movetarget=None, commit=False)
```

Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.

This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.

If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

name: The name of the module function to execute.

rulename(str): The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

action(str): The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

disabled(bool): Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

sourcezone(str, list): The source zone(s). The value 'any' will match all zones.

destinationzone(str, list): The destination zone(s). The value 'any' will match all zones.

source(str, list): The source address(es). The value 'any' will match all addresses.

destination(str, list): The destination address(es). The value 'any' will match all addresses.

application(str, list): The application(s) matched. The value 'any' will match all applications.

service(str, list): The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

description(str): A description for the policy (up to 255 characters).

logsetting(str): The name of a valid log forwarding profile.

logstart(bool): Generates a traffic log entry for the start of a session (disabled by default).

logend(bool): Generates a traffic log entry for the end of a session (enabled by default).

negatesource(bool): Match all but the specified source addresses.

negatedestination(bool): Match all but the specified destination addresses.

profilegroup(str): A valid profile group name.

datafilter(str): A valid data filter profile name. Ignored with the profilegroup option set.

fileblock(str): A valid file blocking profile name. Ignored with the profilegroup option set.

spyware(str): A valid spyware profile name. Ignored with the profilegroup option set.

urlfilter(str): A valid URL filtering profile name. Ignored with the profilegroup option set.

virus(str): A valid virus profile name. Ignored with the profilegroup option set.

vulnerability(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

wildfire(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

move(str): An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

movetarget(str): An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
```

(continues on next page)

(continued from previous page)

```

- legend: True

- wildfire: foobar
- move: after
- movetarget: rule02
- commit: False

```

`salt.states.panos.service_exists`(*name*, *servicename=None*, *vsys=1*, *protocol=None*, *port=None*, *description=None*, *commit=False*)

Ensures that a service object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

name: The name of the module function to execute.

servicename(str): The name of the security object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

protocol(str): The protocol that is used by the service object. The only valid options are tcp and udp.

port(str): The port number that is used by the service object. This can be specified as a single integer or a valid range of ports.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service/tcp-80:
  panos.service_exists:
    - servicename: tcp-80
    - vsys: 1
    - protocol: tcp
    - port: 80
    - description: Hypertext Transfer Protocol
    - commit: False

panos/service/udp-500-550:
  panos.service_exists:
    - servicename: udp-500-550
    - vsys: 3
    - protocol: udp
    - port: 500-550
    - commit: False
```

`salt.states.panos.service_group_exists` (*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service-group/my-group:
  panos.service_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - tcp-80
      - custom-port-group
    - description: A group that needs to exist
    - commit: False
```

`salt.states.panos.set_config` (*name*, *xpath=None*, *value=None*, *commit=False*)

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the *xpath* parameter to specify the location of the object in the configuration

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to set. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/hostname:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/
      ↪system
    - value: <hostname>foobar</hostname>
    - commit: True
```

21.19.204 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

depends pcs

Walkthrough of a complete PCS cluster setup: http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
      ↪node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:  
  pcs.cib_pushed:  
    - cibname: cib_for_galera  
    - scope: None  
    - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:  
  pcs.auth:  
    - nodes:  
      - node1.example.com  
      - node2.example.com  
    - pcsuser: hacluster  
    - pcspasswd: hoonetorg  
    - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:  
  pcs.cluster_setup:  
    - nodes:  
      - node1.example.com  
      - node2.example.com  
    - pcsclustername: pcscluster  
    - extra_args:  
      - '--start'  
      - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:  
  pcs.prop_has_value:  
    - prop: no-quorum-policy  
    - value: ignore  
    - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:  
  pcs.resource_defaults_to:  
    - default: resource-stickiness  
    - value: 100  
    - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:  
  pcs.resource_op_defaults_to:  
    - op_default: monitor-interval  
    - value: 60s  
    - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is often not optional on production ready cluster!):

```

pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith

```

7. Add resources to your cluster:

```

mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
      - '--master'
    - cibname: cib_for_galera

```

8. Optional: Add constraints (locations, colocations, orders):

```

haproxy_pcs__constraint_present_colocation_vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy

```

New in version 2016.3.0.

`salt.states.pcs.auth`(*name, nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None*)

Ensure all nodes are authorized to the cluster

name Irrelevant, not used (recommended: `pcs_auth__auth`)

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with pcs (default: `hacluster`)

pcspasswd password for pcsuser (default: `hacluster`)

extra_args list of extra args for the 'pcs cluster auth' command

Example:

```

pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg

```

(continues on next page)

```
- extra_args: []
```

`salt.states.pcs.cib_present` (*name, cibname, scope=None, extra_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `{{formulaname}}__cib_present_{{cibname}}`)

cibname name/path of the file containing the CIB

scope specific section of the CIB (default:

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cib_pushed` (*name, cibname, scope=None, extra_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with `pcs.cib_present`

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `{{formulaname}}__cib_pushed_{{cibname}}`)

cibname name/path of the file containing the CIB

scope specific section of the CIB

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

`salt.states.pcs.cluster_node_present` (*name, node, extra_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

name Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

node node that should be added

extra_args list of extra args for the 'pcs cluster node add' command

Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

`salt.states.pcs.cluster_setup` (*name, nodes, pcsclustername='pcscluster', extra_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `pcs_setup__setup`)

nodes a list of nodes which should be set up

pcsclustername Name of the Pacemaker cluster

extra_args list of extra args for the 'pcs cluster setup' command

Example:

```

pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'

```

`salt.states.pcs.constraint_present`(*name*, *constraint_id*, *constraint_type*, *constraint_options=None*, *cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: `{{formulaname}}__constraint_present_{{constraint_id}}`)

constraint_id name for the constraint (try first to create manually to find out the autogenerated name)

constraint_type constraint type (location, colocation, order)

constraint_options options for creating the constraint

cibname use a cached CIB-file named like *cibname* instead of the live CIB

Example:

```

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy

```

`salt.states.pcs.prop_has_value`(*name*, *prop*, *value*, *extra_args=None*, *cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: `pcs_properties__prop_has_value_{{prop}}`)

prop name of the property

value value of the property

extra_args additional options for the pcs property command

cibname use a cached CIB-file named like *cibname* instead of the live CIB

Example:

```

pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings

```

`salt.states.pcs.resource_defaults_to`(*name*, *default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: `pcs_properties__resource_defaults_to_{{default}}`)

default name of the default resource property
value value of the default resource property
extra_args additional options for the pcs command
cibname use a cached CIB-file named like cibname instead of the live CIB
 Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_op_defaults_to`(*name*, *op_default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: `pcs_properties__resource_op_defaults_to_{{op_default}}`)

op_default name of the operation default resource property

value value of the operation default resource property

extra_args additional options for the pcs command

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_present`(*name*, *resource_id*, *resource_type*, *resource_options=None*, *cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: `{{formulaname}}__resource_present_{{resource_id}}`)

resource_id name for the resource

resource_type resource type (f.e. `ocf:heartbeat:IPaddr2` or `VirtualIP`)

resource_options additional options for creating the resource

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present`(*name*, *stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibname=None*)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_stonith__created_{{stonith_id}})

stonith_id name for the stonith resource

stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.

stonith_device_options additional options for creating the stonith resource

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

21.19.205 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.installed`(*name*, *version=None*, *defaults=False*, *force=False*, *preferred_state='stable'*)

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install

version The pecl extension version to install. This option may be ignored to install the latest stable version.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

preferred_state The pecl extension state to install

`salt.states.pecl.removed`(*name*)

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall

21.19.206 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends pdbedit

    - password_hashed: True
    - drive: 'X:'
    - homedir: '\\serenity\mechanic\profile'
```

salt.states.pdbedit.absent(*name*)

Ensure user account is absent

name [string] username

salt.states.pdbedit.managed(*name*, ***kwargs*)

Manage user account

login [string] login name

password [string] password

password_hashed [boolean] set if password is a nt hash instead of plain text

domain [string] users domain

profile [string] profile path

script [string] logon script

drive [string] home drive

homedir [string] home directory

fullname [string] full name

account_desc [string] account description

machine_sid [string] specify the machines new primary group SID or rid

user_sid [string] specify the users new primary group SID or rid

account_control [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours

reset_bad_password_count [boolean] reset the stored bad login counter

salt.states.pdbedit.present(*name*, ***kwargs*)

Alias for pdbedit.managed

21.19.207 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

```
salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None,
                                bin_env=None, use_wheel=False, no_use_wheel=False,
                                log=None, proxy=None, timeout=None, repo=None, ed-
                                itable=None, find_links=None, index_url=None, ex-
                                tra_index_url=None, no_index=False, mirrors=None,
                                build=None, target=None, download=None, down-
                                load_cache=None, source=None, upgrade=False,
                                force_reinstall=False, ignore_installed=False, ex-
                                ists_action=None, no_deps=False, no_install=False,
                                no_download=False, install_options=None,
                                global_options=None, user=None, cwd=None, pre_releases=False,
                                cert=None, allow_all_external=False, allow_external=None,
                                allow_unverified=None, process_dependency_links=False,
                                env_vars=None, use_vt=False, trusted_host=None,
                                no_cache_dir=False, cache_dir=None, no_binary=None,
                                **kwargs)
```

Make sure the package is installed

name The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If requirements is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

requirements Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

user The user under which to run pip

use_wheel [False] Prefer wheel archives (requires pip>=1.4)

no_use_wheel [False] Force to not use wheel archives (requires pip>=1.4)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
  pip.installed:
    - no_binary: ':all:'
```

(continues on next page)

(continued from previous page)

```

flask:
  pip.installed:
    - no_binary:
      - itsdangerous
      - click

```

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (i.e. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

find_links URL to look for packages at

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index

mirrors Specific mirror URL(s) to query (automatically adds `-use-mirrors`)

build Unpack packages into `build` dir

target Install packages into `target` dir

download Download packages into `download` instead of installing them

download_cache Cache downloaded packages in `download_cache` dir

source Check out `editable` packages into `source` dir

upgrade Upgrade all packages to the newest available version

force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.

ignore_installed Ignore the installed packages (reinstalling instead)

exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

no_deps Ignore package dependencies

no_install Download and unpack all packages, but don't actually install them

no_cache_dir: Disable the cache.

cwd Current working directory to run pip from

pre_releases Include pre-releases in the available versions

cert Provide a path to an alternate CA bundle

allow_all_external Allow the installation of all externally hosted files

allow_external Allow the installation of externally hosted files (comma separated list)

allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links Enable the processing of dependency links

bin_env [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.

env_vars Add or modify environment variables. Useful for tweaking build steps, such as specifying `INCLUDE` or `LIBRARY` paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```

django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True

```

use_vt Use VT terminal emulation (see output while installing)

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip

```

Or

Example:

```

django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip

```

Attention

The following arguments are deprecated, do not use.

pip_bin [None] Deprecated, use **bin_env**

Changed in version 0.17.0: **use_wheel** option added.

install_options

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```

django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip

```

global_options Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the `pip` state **needs** an importable `pip` module. This usually means having the system's `pip` package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```
pyopenssl:  
  pip.installed:  
    - name: pyOpenSSL  
    - reload_modules: True  
    - exists_action: i
```

`salt.states.pip_state.pip_has_exceptions_mod(ver)`

True when the pip version has the `pip.exceptions` module

`salt.states.pip_state.pip_has_internal_exceptions_mod(ver)`

True when the pip version has the `pip._internal.exceptions` module

`salt.states.pip_state.purge_pip()`

Purge pip and it's sub-modules

`salt.states.pip_state.removed(name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False)`

Make sure that a package is not installed.

name The name of the package to uninstall

user The user under which to run pip

bin_env [None] the pip executable or virtualenv to use

use_vt Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate(name, bin_env=None, user=None, cwd=None, use_vt=False)`

New in version 2015.5.0.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

user The user under which to run pip

bin_env the pip executable or virtualenv to use

use_vt Use VT terminal emulation (see output while installing)

21.19.208 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running `systemd` ≥ 205 , as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the `pkg` state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:  
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```

base:
  pkgrepo.managed:
    - humaname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed:
    - fromrepo: ppa:wolfnet/logstash

```

Multiple packages can also be installed with the use of the pkgs state module

```

dotdeb.repo:
  pkgrepo.managed:
    - humaname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl

```

Warning: Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.downloaded` (*name*, *version=None*, *pkgs=None*, *fromrepo=None*, *ignore_epoch=None*, ***kwargs*)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: *yumpkg* and *zypper*

Parameters

- **name** (*str*) – The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) – Download a specific version of a package.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.downloaded:
    - version: 2:7.4.160-1.el7
```

An `ignore_epoch` argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

- **resolve_capabilities** (*bool*) – Turn on resolving capabilities. This allow one to name “provides” or alias names for packages.

New in version 2018.3.0.

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.group_installed` (*name*, *skip=None*, *include=None*, ***kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in `pacman`

Ensure that an entire package group is installed. This state is currently only supported for the `yum` and `pacman` package managers.

skip Packages that would normally be installed by the package group (“default” packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (“optional” packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

`salt.states.pkg.installed`(*name*, *version=None*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *skip_suggestions=False*, *pkgs=None*, *sources=None*, *allow_updates=False*, *pkg_verify=False*, *normalize=True*, *ignore_epoch=False*, *reinstall=False*, *update_holds=False*, ***kwargs*)

Ensure that the package is installed, and that it is the correct version (if specified).

Parameters

- **name** (*str*) – The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.
- **version** (*str*) – Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `pkgin`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
  2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
  -----
  bash:
    - 4.2.46-21.el7_3
    - 4.2.46-20.el7_2
```

This function was first added for `pkg.list_repo_pkgs` in 2014.1.0, and was expanded to `Debian/Ubuntu` and `Arch Linux`-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```

common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6

```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```

mypkg:
  pkg.installed:
    - version: '1.2.34*'

```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **refresh** (*bool*) – This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- **cache_valid_time** (*str*) – New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```

httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False

```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

- **fromrepo** (*str*) – Specify a repository from which to install

Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy'
↳ ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
       7:0.10.11-1~precise1 0
                    500 http://ppa.launchpad.net/jon-severinsson/
↳ ffmpeg/ubuntu/ precise/main amd64 Packages
                    4:0.8.10-0ubuntu0.12.04.1 0
                    500 http://us.archive.ubuntu.com/ubuntu/ precise-
↳ updates/main amd64 Packages
                    500 http://security.ubuntu.com/ubuntu/ precise-
↳ security/main amd64 Packages
                    4:0.8.1-0ubuntu1 0
                    500 http://us.archive.ubuntu.com/ubuntu/ precise/
↳ main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version `4:0.8.10-0ubuntu0.12.04.1` either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

-
- **skip_verify** (*bool*) – Skip the GPG verification check for the package to be installed
 - **skip_suggestions** (*bool*) – Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

- **resolve_capabilities** (*bool*) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

- **allow_updates** (*bool*) – Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- **pkg_verify** (*bool*) – New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use `pkg.verify` to determine if any of the files installed by the package have been altered. If files have been altered, the `reinstall` option of `pkg.install` is used to force a reinstall. Types to ignore can be passed to `pkg.verify`. Additionally, `verify_options` can be used to modify further the behavior of `pkg.verify`. See examples below. Currently, this option is supported for the following pkg providers: *yumpkg*.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
```

(continues on next page)

(continued from previous page)

```

- config
- doc
- verify_options:
  - nodeps
  - nofiledigest

```

- **ignore_types** (*list*) – List of types to ignore when verifying the package

New in version 2014.7.0.

- **verify_options** (*list*) – List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

- **normalize** (*bool*) – Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```

gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
pkg.installed:
  - normalize: False

```

- **ignore_epoch** (*bool*) – When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`), and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```

# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
pkg.installed:
  - version: 7.4.160-1.el7
  - ignore_epoch: True

```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```

vim-enhanced:
pkg.installed:
  - version: 2:7.4.160-1.el7

```

New in version 2015.8.9.

MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

Parameters

- **pkgs** (*list*) – A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True

```

NOTE: For *apt*, *ebuild*, *pacman*, *winrepo*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz

```

Additionally, *ebuild*, *pacman*, *zypper*, *yum/dnf*, and *apt* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz

```

NOTE: When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```

mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz

```

- **sources** (*list*) – A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```

mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm

```

PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

Parameters

- **hold** (*bool*) – Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

- **update_holds** (*bool*) – If True, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to False.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

- **names** (*list*) – A list of packages to install from a software repository. Each package will be installed individually by the package manager.

Warning: Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **install_recommends** (*bool*) – Whether to install the packages marked as recommended. Default is True. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

- **only_upgrade** (*bool*) – Only upgrade the packages, if they are already installed. Default is False. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

- **report_reboot_exit_codes** (*bool*) – If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```

ms vcpp installed:
pkg.installed:
- name: ms-vcpp
- version: 10.0.40219
- report_reboot_exit_codes: False

```

Returns A dictionary containing the state of the software installation
Rtype dict

Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

`salt.states.pkg.latest`(*name*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *watch_flags=True*, ***kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.

fromrepo Specify a repository from which to install

skip_verify Skip the GPG verification check for the package to be installed

refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```

httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300

```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

param bool resolve_capabilities Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

pkgs A list of packages to maintain at the latest available version.

```

mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz

```

install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```

httpd:
  pkg.latest:
    - install_recommends: False

```

only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```

httpd:
  pkg.latest:
    - only_upgrade: True

```

Note: If this parameter is set to `True` and the package is not already installed, the state will fail.

report_reboot_exit_codes If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```

ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False

```

`salt.states.pkg.mod_aggregate` (*low, chunks, running*)

The `mod_aggregate` function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

`salt.states.pkg.mod_watch`(*name*, ***kwargs*)
Install/reinstall a package based on a watch requisite

Note: This state exists to support special handling of the `watch requisite`. It should not be called directly. Parameters for this function should be set by the state being triggered.

`salt.states.pkg.patch_downloaded`(*name*, *advisory_ids=None*, ***kwargs*)
New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.patch_installed`(*name*, *advisory_ids=None*, *downloadonly=None*, ***kwargs*)
New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.purged`(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

name The name of the package to be purged.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to *pkg.installed*, *pkg.removed*, and *pkg.purged* states, which causes the epoch to be disregarded when the state checks to see if the

desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.removed`(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

name The name of the package to be removed.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`), and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, *pkgs=None*, ***kwargs*)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

refresh refresh the package database before checking for new upgrades

pkgs list of packages to upgrade

Parameters

- **cache_valid_time** (*str*) – This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case `cache_valid_time` is set, `refresh` will not take place for amount in seconds since last `apt-get update` executed on the system.

Note: This parameter available only on Debian based distributions, and have no effect on the rest.

- **resolve_capabilities** (*bool*) – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

kwargs Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

21.19.209 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```

salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
  /tmp/pkg:
    pkgbuild.repo
  
```

```

salt.states.pkgbuild.built(name, runas, dest_dir, spec, sources, tgt, template=None,
                             deps=None, env=None, results=None, force=False, saltenv='base',
                             log_dir='/var/log/salt/pkgbuild')
  
```

Ensure that the named package is built and exists in the named directory

name The name to track the build, the name value is otherwise unused

runas The user to run the build process as

dest_dir The directory on the minion to place the built package(s)

spec The location of the spec file (used for rpms)

sources The list of package sources

tgt The target platform to run the build on

template Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading

directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

env A dictionary of environment variables to be set prior to execution. Example:

```
- env:
  DEB_BUILD_OPTIONS: 'nocheck'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

results The names of the expected rpms that will be built

force [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

saltenv The saltenv to use for files downloaded from the salt fileserver

log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

salt.states.pkgbuild.repo (*name*, *keyid=None*, *env=None*, *use_passphrase=False*,
gnupghome='/etc/salt/gpgkeys', *runas='builder'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R50mgHqvydEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

```

gpg_pkg_pub_keyname: gpg_pkg_key.pub

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```

- env:
  OPTIONS: 'ask-passphrase'

```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

Note: This parameter is not used for making yum repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar={'gpg_passphrase' : "my_passphrase" }
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

runas [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

21.19.210 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```

pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"

```

salt.states.pkgng.update_packaging_site(*name*)

21.19.211 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```

base:
  pkgrepo.managed:
    - humaname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
      ↪ repo=os
    - comments:
      - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6

```

```

base:
  pkgrepo.managed:
    - humaname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True

```

```

base:
  pkgrepo.managed:
    - humaname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub

```

```

base:
  pkgrepo.managed:
    - humaname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub

```

```

base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True

```

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a `bug` in their `python-software-properties` package, a missing dependency on `pycurl`, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.absent` (*name*, ***kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

name The name of the package repo, as it would be referred to when running the regular package manager commands.

UBUNTU-SPECIFIC OPTIONS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```

logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash

```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```

logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password

```

keyid If passed, then the GPG key corresponding to the passed KeyID will also be removed.

keyid_ppa [False] If set to True, the GPG key's ID will be looked up from `ppa.launchpad.net` and removed, and the `keyid` argument will be ignored.

Note: This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.managed` (*name*, *ppa=None*, ***kwargs*)

This state manages software package repositories. Currently, `yum`, `apt`, and `zypper` repositories are supported.

YUM/DNF/ZYPPER-BASED SYSTEMS

Note: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single

repo file containing the configuration for a single repo.

name This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. [foo]) for a given repo. Secondly, it will be the name of the file as stored in /etc/yum.repos.d (e.g. /etc/yum.repos.d/foo.conf).

enabled [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

disabled [False] Included to reduce confusion due to APT's use of the disabled argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as enabled. For example passing disabled=True will assume enabled=False.

humanname This is used as the "name" value in the repo file in /etc/yum.repos.d/ (or /etc/zypp/repos.d for SUSE distros).

baseurl The URL to a yum repository

mirrorlist A URL which points to a file containing a collection of baseurls

comments Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

gpgautoimport Only valid for Zypper package manager. If set to True, automatically trust and import public GPG key for the repository. The key should be specified with gpgkey parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as gpgkey or gpgcheck, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

APT-BASED SYSTEMS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

name On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. 'main') which can be added/modified with the comps option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

- disabled** [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.
- enabled** [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.
- architectures** On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.
- comps** On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.
- file** The filename for the `.list` that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages
- dist** This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.
- keyid** The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the `keyserver` option to be set.
- keyserver** This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.
- key_url** URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

Note: Use either `keyid/keyserver` or `key_url`, but not both.

key_text

The string representation of the GPG key to install.

New in version 2018.3.0.

Note: Use either `keyid/keyserver`, `key_url`, or `key_text` but not more than one method.

- consolidate** [False] If set to `True`, this will consolidate all sources definitions to the `sources.list` file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the `sources.list` file. The `consolidate` will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.
- clean_file** [False] If set to `True`, empty the file before config repo

Note: Use with care. This can be dangerous if multiple sources are configured in the same file.

New in version 2015.8.0.

refresh [True] If set to `False` this will skip refreshing the apt package database on debian based systems.

refresh_db [True] Deprecated since version 2018.3.0: Use `refresh` instead.

require_in Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a `require` in the `pkg` state will not work for this.

21.19.212 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
  portage_config.flags:
    - use:
      - openssl
```

`salt.states.portage_config.flags`(*name*, *use=None*, *accept_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)
Enforce the given flags on the given package or DEPEND atom.

Warning: In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name The name of the package or its DEPEND atom
use A list of USE flags
accept_keywords A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords
env A list of environment files
license A list of accepted licenses
properties A list of additional properties
unmask A boolean to unmask the package
mask A boolean to mask the package

21.19.213 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.installed`(*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

options Make sure that the desired non-default options are set

Warning: Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

21.19.214 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The `postgres_cluster` state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
    - name: 'main'
    - version: '9.3'
```

`salt.states.postgres_cluster.absent` (*version, name*)

Ensure that the named cluster is absent

version Version of the postgresql server of the cluster to remove

name The name of the cluster to remove

New in version 2015.XX.

`salt.states.postgres_cluster.present` (*version, name, port=None, encoding=None, locale=None, datadir=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

version Version of the postgresql cluster

name The name of the cluster

port Cluster port

encoding The character encoding scheme to be used in this database

locale Locale with which to create cluster

datadir Where the cluster is stored

New in version 2015.XX.

21.19.215 salt.states.postgres_database

Management of PostgreSQL databases

The `postgres_database` module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

`salt.states.postgres_database.absent` (*name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named database is absent

name The name of the database to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

user System user all operations should be performed on behalf of

New in version 0.17.0.

`salt.states.postgres_database.present` (*name*, *tablespace=*None, *encoding=*None, *lc_collate=*None, *lc_ctype=*None, *owner=*None, *owner_recurse=*False, *template=*None, *user=*None, *maintenance_db=*None, *db_password=*None, *db_host=*None, *db_port=*None, *db_user=*None)

Ensure that the named database is present with the specified properties. For more information about all of these options see `man createdb(1)`

name The name of the database to manage
tablespace Default tablespace for the database
encoding The character encoding scheme to be used in this database
lc_collate The LC_COLLATE setting to be used in this database
lc_ctype The LC_CTYPE setting to be used in this database
owner The username of the database owner
owner_recurse Recurse owner change to all relations in the database
template The template database from which to build this database
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

New in version 0.17.0.

21.19.216 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

| |
|---|
| adminpack:
postgres_extension.present |
|---|

New in version 2014.7.0.

`salt.states.postgres_extension.absent` (*name*, *if_exists=*None, *restrict=*None, *cascade=*None, *user=*None, *maintenance_db=*None, *db_user=*None, *db_password=*None, *db_host=*None, *db_port=*None)

Ensure that the named extension is absent.

name Extension name of the extension to remove
if_exists Add if exist slug
restrict Add restrict slug
cascade Drop on cascade
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

`salt.states.postgres_extension.present` (*name*, *if_not_exists=*None, *schema=*None, *ext_version=*None, *from_version=*None, *user=*None, *maintenance_db=*None, *db_user=*None, *db_password=*None, *db_host=*None, *db_port=*None)

Ensure that the named extension is present.

Note: Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

name The name of the extension to be installed
if_not_exists Add an IF NOT EXISTS parameter to the DDL statement
schema Schema to install the extension into
ext_version Version to install
from_version Old extension version if already installed
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.217 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

frank:
 postgres_group.present

salt.states.postgres_group.absent (*name*, *user=None*, *maintenance_db=None*,
db_password=None, *db_host=None*, *db_port=None*,
db_user=None)

Ensure that the named group is absent

name The groupname of the group to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_group.present (*name*, *createdb=None*, *createroles=None*, *encrypted=None*,
superuser=None, *inherit=None*, *login=None*, *replica-*
tion=None, *password=None*, *refresh_password=None*,
groups=None, *user=None*, *maintenance_db=None*,
db_password=None, *db_host=None*, *db_port=None*,
db_user=None)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name The name of the group to manage
createdb Is the group allowed to create databases?
createroles Is the group allowed to create other roles/users
encrypted Should the password be encrypted in the system catalog?
login Should the group have login perm

inherit Should the group inherit permissions
superuser Should the new group be a "superuser"
replication Should the new group be allowed to initiate streaming replication
password The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is `None` or `True`, the password will be automatically encrypted to the previous format if it is not already done.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the group should be in
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.218 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The `postgres_initdb` module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

`salt.states.postgres_initdb.present` (*name*, *user=None*, *password=None*, *auth='password'*, *encoding='UTF8'*, *locale=None*, *runas=None*, *waldir=None*, *checksums=False*)

Initialize the PostgreSQL data directory

name The name of the directory to initialize

user The database superuser name

password The password to set for the postgres user

auth The default authentication method for local connections

encoding The default encoding for new databases

locale The default locale for new databases

waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas The system user the operation should be performed on behalf of

21.19.219 salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
postgres_language.present:
- maintenance_db: testdb
```

```
plpgsql:
postgres_language.absent:
- maintenance_db: testdb
```

absent (*name*, *maintenance_db*, *user=None*, *db_password=None*,
db_host=None, *db_port=None*, *db_user=None*)

Ensure that a named language is absent in the specified database.

name The name of the language to remove

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

present (*name*, *maintenance_db*, *user=None*,
db_password=None, *db_host=None*, *db_port=None*,
db_user=None)

Ensure that a named language is present in the specified database.

name The name of the language to install

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

21.19.220 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The `postgres_privileges` module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the `grant` option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.absent`(*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Revoke the requested privilege(s) on the specified object(s)

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object_type: table*.

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when revoking group membership

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_privileges.present`(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Grant the requested privilege(s) on the specified object to a role

name Name of the role to which privileges should be granted

object_name Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace

- language
- database
- group
- function

View permissions should specify *object_type*: *table*.

privileges List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when granting group membership

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

21.19.221 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
postgres_schema.present 'dbname' 'name'
```

```
salt.states.postgres_schema.absent(dbname, name, user=None, db_user=None,
                                     db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is absent.

dbname The database's name will work on

name The name of the schema to remove

user system user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

```
salt.states.postgres_schema.present(dbname, name, owner=None, user=None, db_user=None,
                                     db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is present in the database.

dbname The database's name will work on

name The name of the schema to manage
user system user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.222 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
  
```

New in version 2015.8.0.

salt.states.postgres_tablespace.absent(*name*, *user=None*, *maintenance_db=None*,
db_user=None, *db_password=None*, *db_host=None*,
db_port=None)

Ensure that the named tablespace is absent.

name The name of the tablespace to remove
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_tablespace.present(*name*, *directory*, *options=None*, *owner=None*,
user=None, *maintenance_db=None*,
db_password=None, *db_host=None*, *db_port=None*,
db_user=None)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.

name The name of the tablespace to create/manage.
directory The directory where the tablespace will be located, must already exist
options A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0
  
```

owner The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the `user` option)

user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

21.19.223 salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_users module is used to create and manage Postgres users.

frank:

```
postgres_user.present
```

absent (*name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named user is absent

name The username of the user to remove

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

present (*name, createdb=None, createroles=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default_password=None, refresh_password=None, valid_until=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name The name of the system user to manage.

createdb Is the user allowed to create databases?

createroles Is the user allowed to create other users?

encrypted Should the password be encrypted in the system catalog?

login Should the group have login perm

inherit Should the group inherit permissions

superuser Should the new user be a "superuser"

replication Should the new user be allowed to initiate streaming replication

password The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

default_password The password used only when creating the user, unless password is set.

New in version 2016.3.0.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

valid_until A date and time after which the role's password is no longer valid.

groups A string of comma separated groups the user should be in

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user Postgres database username, if different from config or default.

db_password Postgres user's password, if any password, for a specified db_user.

db_host Postgres database host, if different from config or default.

db_port Postgres database port, if different from config or default.

21.19.224 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

key:

```
powerpath.license_present: []
```

salt.states.powerpath.license_absent(*name*)

Ensures that the specified PowerPath license key is absent on the host.

name The license key to ensure is absent

salt.states.powerpath.license_present(*name*)

Ensures that the specified PowerPath license key is present on the host.

name The license key to ensure is present

21.19.225 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm probes management module*

salt.states.probes.managed(*name, probes, defaults=None*)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

Parameters

- **probes** – Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.
- **defaults** – Specifies common parameters for the probes.

SLS Example:

```

rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
        probe1_test3:
          target: 8.8.8.8
          probe_type: http-ping
      probe_name2:
        probe2_test1:
          test_interval: 100
    - defaults:
      target: 10.10.10.10
      probe_count: 15
      test_interval: 3
      probe_type: icmp-ping

```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- *source* - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- *target* - Destination IP Address.
- *probe_count* - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- *probe_interval* - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- *probe_type* - Probe request type. Available options:
 - icmp-ping
 - tcp-ping
 - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```

probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping
probe_name2:
  probe2_test1:

```

(continues on next page)

(continued from previous page)

```

target: 10.10.10.10
probe_count: 15
test_interval: 3
probe_type: icmp-ping

```

21.19.226 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```

httpd-absent:
  process.absent:
    - name: apache2

```

`salt.states.process.absent` (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

name The pattern to match.

user The user to which the process belongs

signal Signal to send to the process(es).

21.19.227 salt.states.proxy module

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```

192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
      - localhost
      - 127.0.0.1

```

`salt.states.proxy.managed` (*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass_domains=None*, *network_service='Ethernet'*)

Manages proxy settings for this minion

name The proxy server to use

port The port used by the proxy server

services A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

user The username to use for the proxy server if required

password The password to use for the proxy server if required

bypass_domains An array of the domains that should bypass the proxy

network_service The network service to apply the changes to, this only necessary on macOS

21.19.228 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

```
salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None,
                                priority=None, expire=None, retry=None, sound=None,
                                api_version=1, token=None)
```

Send a message to a PushOver channel.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:

name The unique name for this event.

user The user or group of users to send the message to. Must be ID of user, not name or email address.

message The message that is to be sent to the PushOver channel.

The following parameters are optional:

title The title to use for the message.

device The device for the user to send the message to.

priority The priority for the message.

expire The message should expire after specified amount of seconds.

retry The message should be resent this many times.

token The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

21.19.229 salt.states.pyenv

Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```

pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps
python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps

```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

`salt.states.pyenv.absent` (*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

name The version of python to uninstall

user: None The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.install_pyenv` (*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `pyenv.root` configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

user: None The user to run pyenv as.

`salt.states.pyenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

name The version of python to install

default [False] Whether to make this python the default.

user: None The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

21.19.230 salt.states.pyrax_queues

Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or pip. This module is greatly inspired by `boto_*` modules from SaltStack code source.

```
myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax
```

`salt.states.pyrax_queues.absent` (*name, provider*)

Ensure the named Rackspace queue is deleted.

name Name of the Rackspace queue.

provider Salt Cloud provider

`salt.states.pyrax_queues.present` (*name, provider*)

Ensure the RackSpace queue exists.

name Name of the Rackspace queue.

provider Salt Cloud Provider

21.19.231 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.mode` (*name, mode, quotatype*)

Set the quota for the system

name The filesystem to set the quota mode on

mode Whether the quota system is on or off

quotatype Must be user or group

21.19.232 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

`salt.states.rabbitmq_cluster.join(name, host, user='rabbit', ram_node=None, runas='root')`

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node `user@host`

name Irrelevant, not used (recommended: `user@host`)

user The user of node to join to (default: `rabbit`)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the `rabbitmq` command as

`salt.states.rabbitmq_cluster.joined(name, host, user='rabbit', ram_node=None, runas='root')`

Ensure the current node joined to a cluster with node `user@host`

name Irrelevant, not used (recommended: `user@host`)

user The user of node to join to (default: `rabbit`)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the `rabbitmq` command as

21.19.233 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.disabled(name, runas=None)`

Ensure the RabbitMQ plugin is disabled.

name The name of the plugin

runas The user to run the `rabbitmq-plugin` command as

`salt.states.rabbitmq_plugin.enabled(name, runas=None)`

Ensure the RabbitMQ plugin is enabled.

name The name of the plugin

runas The user to run the `rabbitmq-plugin` command as

21.19.234 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer Benn Eichhorn <benn@getlocalmeasure.com>

maturity new

platform all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

`salt.states.rabbitmq_policy.absent`(*name*, *vhost='/'*, *runas=None*)

Ensure the named policy is absent

Reference: <http://www.rabbitmq.com/ha.html>

name The name of the policy to remove

runas Name of the user to run the command as

`salt.states.rabbitmq_policy.present`(*name*, *pattern*, *definition*, *priority=0*, *vhost='/'*,
runas=None, *apply_to=None*)

Ensure the RabbitMQ policy exists.

Reference: <http://www.rabbitmq.com/ha.html>

name Policy name

pattern A regex of queues to apply the policy to

definition A json dict describing the policy

priority Priority (defaults to 0)

vhost Virtual host to apply to (defaults to '/')

runas Name of the user to run the command as

apply_to Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

21.19.235 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

`salt.states.rabbitmq_user.absent`(*name*, *runas=None*)

Ensure the named user is absent

name The name of the user to remove

runas User to run the command

`salt.states.rabbitmq_user.present`(*name*, *password=None*, *force=False*, *tags=None*, *perms=()*,
runas=None)

Ensure the RabbitMQ user exists.

name User name

password User's password, if one needs to be set

force If user exists, forcibly change the password

tags Optional list of tags for the user

perms A list of dicts with vhost keys and 3-tuple values

runas Name of the user to run the command

21.19.236 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

```

virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*

```

`salt.states.rabbitmq_vhost.absent` (*name*)

Ensure the RabbitMQ Virtual Host is absent

name Name of the Virtual Host to remove

runas User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.present` (*name*)

Ensure the RabbitMQ VHost exists.

name VHost name

user Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

owner Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

conf Initial conf string to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

write Initial write permissions to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

read Initial read permissions to apply to the VHost and user. Defaults to `*`

Deprecated since version 2015.8.0.

runas Name of the user to run the command

Deprecated since version 2015.8.0.

21.19.237 salt.states.rbac_solaris

Management of Solaris RBAC

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends rbac_solaris,solaris_user

platform solaris,illumos

New in version 2016.11.0.

```

sjorge:
  rbac.managed:
    - roles:
      - netcfg

```

(continues on next page)

(continued from previous page)

- **profiles:**
 - System Power
- **authorizations:**
 - solaris.audit.*

`salt.states.rbac_solaris.managed` (*name*, *roles=None*, *profiles=None*, *authorizations=None*)

Manage RBAC properties for user

name [string] username

roles [list] list of roles for user

profiles [list] list of profiles for user

authorizations [list] list of authorizations for user

Warning: All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.

Set the property to *None* to not manage it.

21.19.238 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: <https://github.com/sstephenson/ruby-build/wiki>

If rbenv is run as the root user then it will be installed to `/usr/local/rbenv`, otherwise it will be installed to the users `~/.rbenv` directory. To make rbenv available in the shell you may need to add the `rbenv/shims` and `rbenv/bin` directories to the users `PATH`. If you are installing as root and want other users to be able to access rbenv then you will need to add `RBENV_ROOT` to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
```

(continues on next page)

(continued from previous page)

| |
|---|
| <pre> rbenv.absent: - require: - pkg: rbenv-deps ruby-2.0.0-p598: rbenv.installed: - default: True - require: - pkg: rbenv-deps </pre> |
|---|

`salt.states.rbenv.absent` (*name*, *user=None*)

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to uninstall

user: None The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.rbenv.install_rbenv` (*name*, *user=None*)

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `rbenv.root` configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.

user: None The user to run rbenv as.

`salt.states.rbenv.installed` (*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: None The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

21.19.239 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.disabled` (*name*)

Disable the RDP service

`salt.states.rdp.enabled` (*name*)

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

21.19.240 salt.states.redismod

Management of Redis server

New in version 2014.7.0.

depends

- redis Python module

configuration See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The redis server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.absent`(*name*, *keys=None*, ***connection_args*)

Ensure key absent from redis

name Key to ensure absent from redis

keys list of keys to ensure absent, name will be ignored if this is used

`salt.states.redismod.slaveof`(*name*, *sentinel_host=None*, *sentinel_port=None*, *sentinel_password=None*, ***connection_args*)

Set this redis instance as a slave.

name Master to make this a slave of

sentinel_host Ip of the sentinel to check for the master

sentinel_port Port of the sentinel to check for the master

`salt.states.redismod.string`(*name*, *value*, *expire=None*, *expireat=None*, ***connection_args*)

Ensure that the key exists in redis with the value specified

name Redis key to manage

value Data to persist in key

expire Sets time to live for key in seconds

expireat Sets expiration time for key via UNIX timestamp, overrides *expire*

21.19.241 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.

- HKEY_CLASSES_ROOT (HKCR)
- HKEY_CURRENT_USER (HKCU)
- HKEY_LOCAL_MACHINE (HKLM)
- HKEY_USER (HKU)
- HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (`\` vs `\\`). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

Using **single backslashes**: `HKLMSOFTWAREPython 'HKLMSOFTWAREPython'`

Using **double backslashes**: `"HKLM\SOFTWARE\Python"`

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (`Default`) with a displayed value of (`value not set`). The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.
↪exe\"
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmsllex.
↪dll\",TrayApp"
```

In this example these are the values for each:

Hive: `HKEY_LOCAL_MACHINE`

Key and subkeys: `SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.absent` (*name*, *vname=None*, *use_32bit_registry=False*)

Ensure a registry value is removed. To remove a key use `key_absent`.

Parameters

- **name** (*str*) – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt
```

Valid hive values include:

- `HKEY_CURRENT_USER` or `HKCU`
- `HKEY_LOCAL_MACHINE` or `HKLM`
- `HKEY_USERS` or `HKU`
- **vname** (*str*) – The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (`Default`) value
- **use_32bit_registry** (*bool*) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is `False`.

Returns A dictionary showing the results of the registry operation.

Return type `dict`

CLI Example:

```
'HKEY_CURRENT_USER\\SOFTWARE\\Salt':
  reg.absent
  - vname: version
```

In the above example the value named `version` will be removed from the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive. If `vname` was not passed, the (`Default`) value would be deleted.

`salt.states.reg.key_absent` (*name*, *use_32bit_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

Parameters

- **name** (*str*) – A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
 - `HKEY_LOCAL_MACHINE` or `HKLM`
 - `HKEY_CURRENT_USER` or `HKCU`
 - `HKEY_USER` or `HKU`
- **use_32bit_registry** (*bool*) – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is `False`.

Returns A dictionary showing the results of the registry operation.

Return type `dict`

CLI Example:

The following example will delete the `SOFTWARE\DeleteMe` key in the `HKEY_LOCAL_MACHINE` hive including all its subkeys and value pairs.

```
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\DeleteMe` is the key

`salt.states.reg.present` (*name*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, *win_perms_reset=False*)

Ensure a registry key or value is present.

Parameters

- **name** (*str*) – A string value representing the full path of the key to include the `HIVE`, `Key`, and all `Subkeys`. For example:

```
HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt
```

Valid hive values include:

 - `HKEY_CURRENT_USER` or `HKCU`
 - `HKEY_LOCAL_MACHINE` or `HKLM`
 - `HKEY_USERS` or `HKU`
- **vname** (*str*) – The name of the value you'd like to create beneath the `Key`. If this parameter is not passed it will assume you want to set the (`Default`) value
- **vdata** (*str*, *int*, *list*, *bytes*) – The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (`Default`) value for the key.

The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:

- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

Note: When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:

- vdata: Salty Test
- vdata: !!binary U2FsdHkgVGZzdA==\n

For more information about the `!!binary` tag see [here](#)

Note: The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **vtype** (*str*) - The value type for the data you wish to store in the registry. Valid values are:
 - REG_BINARY
 - REG_DWORD
 - REG_EXPAND_SZ
 - REG_MULTI_SZ
 - REG_QWORD
 - REG_SZ (Default)
- **use_32bit_registry** (*bool*) - Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.
- **win_owner** (*str*) - The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

Note: Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms** (*dict*) - A dictionary containing permissions to grant and their propagation. If not passed the 'Grant' permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

For each user specify the account name, with a sub dict for the permissions to grant and the 'Applies to' setting. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}`. perms must be specified.

Registry permissions are specified using the perms key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

- Basic (passed as a string):**
- full_control

- read
- write

Advanced (passed as a list):

- delete
- query_value
- set_value
- create_subkey
- enum_subkeys
- notify
- create_link
- read_control
- write_dac
- write_owner

The 'Applies to' setting is optional. It is specified using the `applies_to` key. If not specified `this_key_subkeys` is used. Valid options are:

Applies to settings:

- this_key_only
- this_key_subkeys
- subkeys_only

New in version 2019.2.0.

- **win_deny_perms** (*dict*) - A dictionary containing permissions to deny and their propagation. If not passed the *Deny* permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

Valid options are the same as those specified in `win_perms`

Note:

'Deny' permissions always take precedence over 'grant' permissions.

New in version 2019.2.0.

- **win_inheritance** (*bool*) - True to inherit permissions from the parent key. False to disable inheritance. Default is True.

Note: Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms_reset** (*bool*) - If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False

Note: Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

New in version 2019.2.0.

Returns A dictionary showing the results of the registry operation.

Return type `dict`

Example:

The following example will set the (Default) value for the SOFTWARE\\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
reg.present:
- vdata: 2016.3.1
```

Example:

The following example will set the value for the version entry under the SOFTWARE\\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1. The value will be reflected in Wow6432Node:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
reg.present:
- vname: version
- vdata: 2016.3.1
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\\Salt is the key
- vname is the value name ('version') that will be created under the key
- vdata is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of Salty Test

```
no_conversion:
reg.present:
- name: HKLM\\SOFTWARE\\SaltTesting
- vname: test_reg_binary_state
- vdata: Salty Test
- vtype: REG_BINARY

conversion:
reg.present:
- name: HKLM\\SOFTWARE\\SaltTesting
- vname: test_reg_binary_state_with_tag
- vdata: !!binary U2FsdHkgVGZzdA==\n
- vtype: REG_BINARY
```

Example:

To set a REG_MULTI_SZ value:

```
reg_multi_sz:
reg.present:
- name: HKLM\\SOFTWARE\\Salt
- vname: reg_multi_sz
- vdata:
- list item 1
- list item 2
```

Example:

To ensure a key is present and has permissions:

```
set_key_permissions:
reg.present:
- name: HKLM\\SOFTWARE\\Salt
```

(continues on next page)

(continued from previous page)

```

- vname: version
- vdata: 2016.3.1
- win_owner: Administrators
- win_perms:
  jsnuffy:
    perms: full_control
  sjones:
    perms:
      - read_control
      - enum_subkeys
      - query_value
    applies_to:
      - this_key_only
- win_deny_perms:
  bsimpson:
    perms: full_control
    applies_to: this_key_subkeys
- win_inheritance: True
- win_perms_reset: True

```

21.19.242 salt.states.rsyc

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```

/opt/user-backups:
  rsync.synchronized:
    - source: /home
    - force: True

```

`salt.states.rsyc.synchronized`(*name*, *source*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *prepare=False*, *dryrun=False*, *additional_opts=None*)

Guarantees that the source directory is always copied to the target.

name Name of the target directory.

source Source directory.

prepare Create destination directory if it does not exist.

delete Delete extraneous files from the destination dirs (True or False)

force Force deletion of dirs even if not empty

update Skip files that are newer on the receiver (True or False)

passwordfile Read daemon-access password from the file (path)

exclude Exclude files, that matches pattern.

excludefrom Read exclude patterns from the file (path)

dryrun Perform a trial run with no changes made. Is the same as doing `test=True`

New in version 2016.3.1.

additional_opts Pass additional options to rsync, should be included as a list.

New in version 2018.3.0.

21.19.243 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```

rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
      - openssl
      - libreadline6
      - libreadline6-dev
      - curl
      - git-core
      - zlib1g
      - zlib1g-dev
      - libssl-dev
      - libyaml-dev
      - libsqlite3-0
      - libsqlite3-dev
      - sqlite3
      - libxml2-dev
      - libxslt1-dev
      - autoconf
      - libc6-dev
      - libncurses5-dev
      - automake
      - libtool
      - bison
      - subversion
      - ruby

jruby-deps:

```

(continues on next page)

(continued from previous page)

```

pkg.installed:
- pkgs:
- curl
- g++
- openjdk-6-jre-headless

ruby-1.9.2:
rvm.installed:
- default: True
- user: rvm
- require:
- pkg: rvm-deps
- pkg: mri-deps
- user: rvm

jruby:
rvm.installed:
- user: rvm
- require:
- pkg: rvm-deps
- pkg: jruby-deps
- user: rvm

jgemset:
rvm.gemset_present:
- ruby: jruby
- user: rvm
- require:
- rvm: jruby

mygemset:
rvm.gemset_present:
- ruby: ruby-1.9.2
- user: rvm
- require:
- rvm: ruby-1.9.2

```

`salt.states.rvm.gemset_present` (*name*, *ruby*='default', *user*=None)

Verify that the gemset is present.

name The name of the gemset.

ruby: default The ruby version this gemset belongs to.

user: None The user to run rvm as.

New in version 0.17.0.

`salt.states.rvm.installed` (*name*, *default*=False, *user*=None, *opts*=None, *env*=None)

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: None The user to run rvm as.

env: None A list of environment variables to set (ie, RUBY_CONFIGURE_OPTS)

opts: None A list of option flags to pass to RVM (ie -C, -patch)

New in version 0.17.0.

21.19.244 salt.states.salt_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

This state will configure the salt proxy settings within `/etc/salt/proxy` (if `/etc/salt/proxy` doesn't exist) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.configure_proxy(name, proxyname='p8000', start=True)`

Create the salt proxy file and start the proxy process if required

Parameters

- **name** – The name of this state
- **proxyname** – Name to be used for this proxy (should match entries in pillar)
- **start** – Boolean indicating if the process should be started

Example:

..code-block:: yaml

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxyname: p8000
    - start: True
```

21.19.245 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [The Orchestrate runner](#)

```
salt.states.saltmod.function(name, tgt, ssh=False, tgt_type='glob', ret="", ret_config=None,
                               ret_kwargs=None, expect_minions=False, fail_minions=None,
                               fail_function=None, arg=None, kwarg=None, timeout=None,
                               batch=None, subset=None, failhard=None, **kwargs)
```

Execute a single module function on a remote minion via salt or salt-ssh

name The name of the function to run, aka cmd.run or pkg.install
tgt The target specification, aka '*' for all minions
tgt_type The target type, defaults to glob
arg The list of arguments to pass into the function
kwarg The dict (not a list) of keyword arguments to pass into the function
ret Optionally set a single or a list of returners to use
ret_config Use an alternative returner configuration
ret_kwargs Override individual returner configuration items
expect_minions An optional boolean for failing if some minions do not respond
fail_minions An optional list of targeted minions where failure is an option
fail_function An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions
ssh Set to *True* to use the ssh client instead of the standard salt client
batch Execute the command *in batches*. E.g.: 10%.
subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard pass failhard down to the executing state

New in version 2019.2.2.

```
salt.states.saltmod.parallel_runners(name, runners, **kwargs)
```

Executes multiple runner modules on the master in parallel.

New in version 2017.x.0: (Nitrogen)

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the `saltmod.runner` state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

name: name identifying this state. The name is provided as part of the output, but not used for anything else.
runners: list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary's name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.

```
parallel-state:
  salt.parallel_runners:
    - runners:
      my_runner_1:
        - name: state.orchestrate
        - kwarg:
            mods: orchestrate_state_1
      my_runner_2:
        - name: state.orchestrate
        - kwarg:
            mods: orchestrate_state_2
```

```
salt.states.saltmod.runner(name, **kwargs)
```

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run
kwargs Any keyword arguments to pass to the runner function

```
run-manage-up:
salt.runner:
- name: manage.up
```

```
salt.states.saltmod.state(name, tgt, ssh=False, tgt_type='glob', ret="", ret_config=None,
ret_kwargs=None, highstate=None, sls=None, top=None, saltenv=None,
test=None, pillar=None, pillarenv=None, expect_minions=True,
fail_minions=None, allow_fail=0, concurrent=False, timeout=None,
batch=None, queue=False, subset=None, orchestration_jid=None, fail-
hard=None, **kwargs)
```

Invoke a state run on a given target

name An arbitrary name used to track the state execution

tgt The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

tgt_type The target type to resolve, defaults to `glob`

ret Optionally set a single or a list of returners to use

ret_config Use an alternative returner configuration

ret_kwargs Override individual returner configuration items

highstate Defaults to `None`, if set to `True` the target systems will ignore any `sls` references specified in the `sls` option and call `state.highstate` on the targeted minions

top Should be the name of a top file. If set `state.top` is called with this top file instead of `state.sls`.

sls A group of `sls` files to execute. This can be defined as a single string containing a single `sls` file, or a list of `sls` files

test Pass `test=true` or `test=false` through to the state function. This can be used to override a test mode set in the minion's config file. If left as the default of `None` and the 'test' mode is supplied on the command line, that value is passed instead.

pillar Pass the `pillar` kwarg through to the state function

pillarenv The pillar environment to grab pillars from

New in version 2017.7.0.

saltenv The default salt environment to pull `sls` files from

ssh Set to `True` to use the `ssh` client instead of the standard salt client

roster In the event of using `salt-ssh`, a roster system can be set

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to `False`

concurrent Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue Pass `queue=true` through to the state function

batch Execute the command *in batches*. E.g.: 10%.

New in version 2016.3.0.

subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard pass failhard down to the executing state

New in version 2019.2.2.

Examples:

Run a list of `sls` files via `state.sls` on target minions:

```

webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod

```

Run a full `state.highstate` on target minions.

```

databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True

```

`salt.states.saltmod.wait_for_event`(*name*, *id_list*, *event_id='id'*, *timeout=300*, *node='master'*)
 Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

name An event tag to watch for; supports Reactor-style globbing.

id_list A list of event identifiers to watch for – usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

event_id [*id*] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

timeout [*300*] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```

reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions

```

`salt.states.saltmod.wheel`(*name*, ***kwargs*)

Execute a wheel module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the wheel function

```

accept_minion_key:
  salt.wheel:

```

(continues on next page)

(continued from previous page)

- **name:** key.accept
- **match:** frank

21.19.246 salt.states.schedule

Management of the Salt scheduler

job3:

schedule.present:

- **function:** test.ping
- **seconds:** 3600
- **splay:** 10

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

job2:

schedule.present:

- **function:** test.ping
- **seconds:** 15
- **splay:**
 - start:** 10
 - end:** 20

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

job1:

schedule.present:

- **function:** state.sls
- **job_args:**
 - httpd
- **job_kwargs:**
 - test:** True
- **when:**
 - Monday 5:00pm
 - Tuesday 3:00pm
 - Wednesday 5:00pm
 - Thursday 3:00pm
 - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

job1:

schedule.present:

- **function:** state.sls
- **job_args:**
 - httpd
- **job_kwargs:**
 - test:** True
- **cron:** '* /5 * * * *'

(continues on next page)

(continued from previous page)

Scheduled jobs can also be specified using the format used by cron. This will **schedule the command**: `state.sls httpd test=True` to run every 5 minutes. Requires that `python-croniter` is installed on the minion.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - when:
      - Monday 5:00pm
      - Tuesday 3:00pm
      - Wednesday 5:00pm
      - Thursday 3:00pm
      - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
      recipient: user@domain.com

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the `xmpp` returner to return the results of the scheduled job, with the alternative configuration options found in the `xmpp_state_run` section.

```

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      test: True
    - hours: 1
    - skip_during_range:
      - start: 2pm
      - end: 3pm
    - run_after_skip_range: True

```

This will schedule the command: `state.sls httpd test=True` at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that `python-dateutil` is installed on the minion.

`salt.states.schedule.absent`(*name*, ***kwargs*)

Ensure a job is absent from the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.disabled`(*name*, ***kwargs*)

Ensure a job is disabled in the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.enabled`(*name*, ***kwargs*)

Ensure a job is enabled in the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

`salt.states.schedule.present`(*name*, ***kwargs*)

Ensure a job is present in the schedule

name The unique name that is given to the scheduled job.

seconds The scheduled job will be executed after the specified number of seconds have passed.

minutes The scheduled job will be executed after the specified number of minutes have passed.

hours The scheduled job will be executed after the specified number of hours have passed.

days The scheduled job will be executed after the specified number of days have passed.

when This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.

cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.

run_on_start Whether the job will run when Salt minion start. Value should be a boolean.

function The function that should be executed by the scheduled job.

job_args The arguments that will be used by the scheduled job.

job_kwargs The keyword arguments that will be used by the scheduled job.

maxrunning Ensure that there are no more than N copies of a particular job running.

jid_include Include the job into the job cache.

splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.

range This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

once This will schedule a job to run once on the specified date.

once_fmt The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.

enabled Whether the job should be enabled or disabled. Value should be a boolean.

return_job Whether to return information to the Salt master upon job completion.

metadata Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the `return_job` parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.

returner The returner to use to return the results of the scheduled job.

return_config The alternative configuration to use for returner configuration options.

return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.

persist Whether the job should persist between minion restarts, defaults to True.

skip_during_range This will ensure that the scheduled command does not run within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

run_after_skip_range Whether the job should run immediately after the `skip_during_range` time period ends.

21.19.247 salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
  selinux.mode

samba_create_home_dirs:
  selinux.boolean:
    - value: True
    - persist: True
```

(continues on next page)

(continued from previous page)

```

nginx:
  selinux.module:
    - enabled: False

```

Note: Use of these states require that the *selinux* execution module is available.

salt.states.selinux.boolean(*name, value, persist=False*)

Set up an SELinux boolean

name The name of the boolean to set

value The value to set on the boolean

persist Defaults to False, set persist to true to make the boolean apply on a reboot

salt.states.selinux.fcontext_policy_absent(*name, filetype='a', sel_type=None, sel_user=None, sel_level=None*)

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (*name*), filetype and SELinux context type is absent.

name filespec of the file or directory. Regex syntax is allowed.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_type The SELinux context type. There are many.

sel_user The SELinux user.

sel_level The SELinux MLS range.

salt.states.selinux.fcontext_policy_applied(*name, recursive=False*)

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

salt.states.selinux.fcontext_policy_present(*name, sel_type, filetype='a', sel_user=None, sel_level=None*)

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (*name*), filetype and SELinux context type is present.

name filespec of the file or directory. Regex syntax is allowed.

sel_type SELinux context type. There are many.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_user The SELinux user.

sel_level The SELinux MLS range.

salt.states.selinux.mode(*name*)

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name The mode to run SELinux in, permissive, enforcing, or disabled.

salt.states.selinux.module(*name, module_state='Enabled', version='any', **opts*)

Enable/Disable and optionally force a specific version for an SELinux module

name The name of the module to control

module_state Should the module be enabled or disabled?

version Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

install Setting to True installs module
source Points to module source file, used only when install is True
remove Setting to True removes module
 New in version 2016.3.0.

`salt.states.selinux.module_install(name)`

Installs custom SELinux module from given file
name Path to file with module to install
 New in version 2016.11.6.

`salt.states.selinux.module_remove(name)`

Removes SELinux module
name The name of the module to remove
 New in version 2016.11.6.

`salt.states.selinux.port_policy_absent(name, sel_type=None, protocol=None, port=None)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type The SELinux Type. Optional; can be used in determining if policy is present, ignored by `semanage port --delete`.
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
port The port or port range. Required if name is not formatted.

`salt.states.selinux.port_policy_present(name, sel_type, protocol=None, port=None, sel_range=None)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.

name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type The SELinux Type.
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
port The port or port range. Required if name is not formatted.
sel_range The SELinux MLS/MCS Security Range.

21.19.248 salt.states.serverdensity_device

Monitor Server with Server Density

New in version 2014.7.0.

Server Density Is a hosted monitoring service.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bfff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

Note: Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

```
salt.states.serverdensity_device.monitored(name, group=None, salt_name=True,
                                           salt_params=True, agent_version=1,
                                           **params)
```

Device is monitored with Server Density.

name Device name in Server Density.

salt_name If True (default), takes the name from the `id` grain. If False, the provided name is used.

group Group name under which device will appear in Server Density dashboard. Default - *None*.

agent_version The agent version you want to use. Valid values are 1 or 2. Default - 1.

salt_params If True (default), needed config parameters will be sourced from grains and from `status.all_status`.

params Add parameters that you want to appear in the Server Density dashboard. Will overwrite the `salt_params` parameters. For more info, see the [API docs](#).

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

21.19.249 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state uses whichever service module is loaded on the minion with the virtualname of `service`. Services can be defined as either running or dead.

If you need to know if your init system is supported, see the list of supported `service` modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the [Overriding Virtual Module Providers](#) section of Salt's module documentation to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```
httpd:
  service.running: []
```

The service can also be set to start at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

Note: More details regarding watch can be found in the [Requisites](#) documentation.

`salt.states.service.dead(name, enable=None, sig=None, init_delay=None, **kwargs)`

Ensure that the named service is dead by stopping the service if it is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `NONE`, which does not enable or disable anything.

sig The string to search for when looking for the service process with `ps`

init_delay Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

no_block [False] **For systemd minions only.** Stops the service using `--no-block`.

New in version 2017.7.0.

`salt.states.service.disabled(name, **kwargs)`

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the `enable: False` option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.enabled(name, **kwargs)`

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the `enable: True` option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.masked`(*name*, *runtime=False*)

New in version 2017.7.0.

Note: This state is only available on minions which use `systemd`.

Ensures that the named service is masked (i.e. prevented from being started).

name Name of the service to mask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will `_not_` remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a `service.unmasked` state, like so:

```
mask_runtime_foo:
  service.masked:
    - name: foo
    - runtime: True

unmask_indefinite_foo:
  service.unmasked:
    - name: foo
    - runtime: False
```

`salt.states.service.mod_watch`(*name*, *sfun=None*, *sig=None*, *reload=False*, *full_restart=False*, *init_delay=None*, *force=False*, ***kwargs*)

The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

Note: This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the watching service. (i.e. `service.running`)

name The name of the init or rc script used to manage the service

sfun The original function which triggered the `mod_watch` call (`service.running`, for example).

sig The string to search for when looking for the service process with `ps`

reload When set, reload the service instead of restarting it. (i.e. `service nginx reload`)

full_restart Perform a full stop/start of a service by passing `--full-restart`. This option is ignored if `reload` is set and is supported by only a few *service modules*.

force Use `service.force_reload` instead of `reload` (needs `reload` to be set to `True`)

init_delay Add a sleep command (in seconds) before the service is restarted/reloaded

`salt.states.service.running`(*name*, *enable=None*, *sig=None*, *init_delay=None*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, ***kwargs*)

Ensure that the service is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with `ps`

init_delay Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an `'init_delay'` to specify that this state should wait an additional given

number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

no_block [False] **For systemd minions only.** Starts the service using `--no-block`.

New in version 2017.7.0.

unmask [False] **For systemd minions only.** Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

unmask_runtime [False] **For systemd minions only.** Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

Note:

watch can be used with `service.running` to restart a service when another state changes (example: a `file.managed` state that creates the service's config file). More details regarding `watch` can be found in the [Requisites](#) documentation.

`salt.states.service.unmasked`(*name*, *runtime=False*)

New in version 2017.7.0.

Note: This state is only available on minions which use `systemd`.

Ensures that the named service is unmasked

name Name of the service to unmask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will `_not_` remove the indefinite mask.

21.19.250 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.post_message` (*name, channel, from_name, message, api_key=None, icon=None*)
Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

name The unique name for this event.

channel The channel to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the "from" field.

message The message that is to be sent to the Slack channel.

The following parameters are optional:

api_key The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

icon URL to an image to use as the icon for this message

21.19.251 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends vmadm, imgadm

platform smartos

New in version 2016.3.0.

```
vmtest.example.org:
  smartos.vm_present:
    - config:
        reprovision: true
    - vmconfig:

    resolvers:
      - 172.16.1.1

```

(continues on next page)

(continued from previous page)

```

nics:
  "82:1b:8e:49:e9:18":
    nic_tag: trunk
    mtu: 1500
    ips:
      - 172.16.1.118/24
    vlan_id: 10
filesystems:
  "/config":
    source: "/vmdata/emby_config"
    type: lofs
    options:
      - nodevices

cleanup_images:
  smartos.image_vacuum

```

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via `add_*`, `set_*`, `update_*`, and `remove_*`. Properties must be manually reset to their default value. The same behavior as when using 'vmadm update'.

salt.states.smartos.config_absent(*name*)
 Ensure configuration property is absent in /usbkey/config
name [string] name of property

salt.states.smartos.config_present(*name, value*)
 Ensure configuration property is set to value in /usbkey/config
name [string] name of property
value [string] value of property

salt.states.smartos.image_absent(*name*)
 Ensure image is absent on the computenode
name [string] uuid of image

Note: computenode.image_absent will only remove the image if it is not used by a vm.

salt.states.smartos.image_present(*name*)
 Ensure image is present on the computenode
name [string] uuid of image

salt.states.smartos.image_vacuum(*name*)
 Delete images not in use or installed via image_present

Warning: Only image_present states that are included via the top file will be detected.

salt.states.smartos.source_absent(*name*)
 Ensure an image source is absent on the computenode
name [string] source url

salt.states.smartos.source_present(*name, source_type='imgapi'*)
 Ensure an image source is present on the computenode
name [string] source url
source_type [string] source type (imgapi or docker)

`salt.states.smartos.vm_absent`(*name*, *archive=False*)

Ensure vm is absent on the computenode

name [string] hostname of vm

archive [boolean] toggle archiving of vm on removal

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.vm_present`(*name*, *vmconfig*, *config=None*)

Ensure vm is present on the computenode

name [string] hostname of vm

vmconfig [dict] options to set for the vm

config [dict] fine grain control over vm_present

Note:

The following configuration properties can be toggled in the config parameter.

- `kvm_reboot` (true) - reboots of kvm zones if needed for a config update
 - `auto_import` (false) - automatic importing of missing images
 - `auto_lx_vars` (true) - copy kernel_version and docker:* variables from image
 - `reprovision` (false) - reprovision on image_uuid changes
 - `enforce_tags` (true) - false = add tags only, true = add, update, and remove tags
 - `enforce_routes` (true) - false = add tags only, true = add, update, and remove routes
 - `enforce_internal_metadata` (true) - false = add metadata only, true = add, update, and remove metadata
 - `enforce_customer_metadata` (true) - false = add metadata only, true = add, update, and remove metadata
-

Note: State ID is used as hostname. Hostnames must be unique.

Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

Note:

The following instances should have a unique ID.

- `nic` : mac
- `filesystem`: target
- `disk` : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

Changed in version 2019.2.0: Added support for docker image uuids, added `auto_lx_vars` configuration, documented some missing configuration options.

`salt.states.smartos.vm_running`(*name*)

Ensure vm is in the running state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.vm_stopped`(*name*)

Ensure vm is in the stopped state on the computenode
name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

21.19.252 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - recipient: admins@example.com
```

`salt.states.smtp.send_msg`(*name*, *recipient*, *subject*, *sender=None*, *profile=None*, *use_ssl='True'*, *attachments=None*)

Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
    - attachments:
      - /var/log/syslog
      - /var/log/messages
```

name The message to send via SMTP

21.19.253 salt.states.snapper module

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```
my_baseline_external_storage:
  snapper.baseline_snapshot:
    • tag: my_custom_baseline_tag
    • config: external
    • ignore: - /mnt/tmp_files/
```

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache

hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

Warning: Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

Warning: Do not specify more than one baseline rule as only the last one will affect the result.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>

maturity new

platform Linux

`salt.states.snapper.baseline_snapshot`(*name*, *number=None*, *tag=None*, *include_diff=True*,
config='root', *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

number Number of selected baseline snapshot.

tag Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

include_diff Include a diff in the response (Default: True)

config Snapper config name (Default: root)

ignore List of files to ignore. (Default: None)

21.19.254 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

`salt.states.solrcloud.alias`(*name*, *collections*, ***kwargs*)

Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query

name The collection name

collections list of collections to include in the alias

`salt.states.solrcloud.collection`(*name*, *options=None*, ***kwargs*)

Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query

name The collection name

options [{}] options to ensure

21.19.255 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
  splunk.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
```

`salt.states.splunk.absent` (*email*, *profile='splunk'*, ***kwargs*)

Ensure a splunk user is absent

```
ensure example test user 1:
  splunk.absent:
    - email: 'example@domain.com'
    - name: 'exampleuser'
```

The following parameters are required:

email This is the email of the user in splunk

name This is the splunk username used to identify the user.

`salt.states.splunk.present` (*email*, *profile='splunk'*, ***kwargs*)

Ensure a user is present

```
ensure example test user 1:
  splunk.user_present:
    - realname: 'Example TestUser1'
    - name: 'exampleuser'
    - email: 'example@domain.com'
    - roles: ['user']
```

The following parameters are required:

email This is the email of the user in splunk

21.19.256 salt.states.splunk_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```
server-warning-message:
  splunk_search.present:
    - name: This is the splunk search name
    - search: index=main sourcetype=
```

`salt.states.splunk_search.absent` (*name*, *profile='splunk'*)

Ensure a search is absent

```
API Error Search:
  splunk_search.absent
```

The following parameters are required:

name This is the name of the search in splunk

`salt.states.splunk_search.present` (*name*, *profile='splunk'*, ***kwargs*)

Ensure a search is present

```

API Error Search:
splunk_search.present:
  search: index=main sourcetype=blah
  template: alert_5min

```

The following parameters are required:
name This is the name of the search in splunk

21.19.257 salt.states.sqlite3

Management of SQLite3 databases

New in version 2016.3.0.

depends

- SQLite3 Python Module

configuration See *salt.modules.sqlite3* for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```

users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
↪ `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)

```

Here is an example of creating a table using yaml/jinja instead of sql:

```

users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
      - email TEXT COLLATE NOCASE UNIQUE NOT NULL
      - firstname TEXT NOT NULL
      - lastname TEXT NOT NULL
      - company TEXT NOT NULL
      - password BLOB NOT NULL
      - salt BLOB NOT NULL

```

Here is an example of making sure a table is absent:

```

badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite

```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```

user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'

```

(continues on next page)

(continued from previous page)

```

- data:
  email: john.doe@companyxyz.com
  lastname: doe
  firstname: john
  company: companyxyz.com
  password: abcdef012934125
  salt: abcdef012934125
- require:
  - sqlite3: users

```

Here is an example of removing a row from a table:

```

user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users

```

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3's module functions and module.run:

```

zone-delete:
  module.run:
    - name: sqlite3.modify
    - db: {{ db }}
    - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_
↵id }}"
    - watch:
      - sqlite3: zone-insert-12

```

`salt.states.sqlite3.row_absent`(*name*, *db*, *table*, *where_sql*, *where_args=None*)

Makes sure the specified row is absent in db. If multiple rows match *where_sql*, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check

where_sql The sql to select the row to check

where_args The list parameters to substitute in *where_sql*

`salt.states.sqlite3.row_present`(*name*, *db*, *table*, *data*, *where_sql*, *where_args=None*, *update=False*)

Checks to make sure the given row exists. If row exists and *update* is True then row will be updated with *data*. Otherwise it will leave existing row unmodified and check it against *data*. If the existing data doesn't match *data_check* the state will fail. If the row doesn't exist then it will insert data into the table. If more than one row matches, then the state will fail.

name Only used as the unique ID

db The database file name

table The table name to check the data

data The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

where_sql The sql to select the row to check

where_args The list parameters to substitute in *where_sql*

update True will replace the existing row with *data* When False and the row exists and *data* does not equal the row data then the state will fail

`salt.states.sqlite3.table_absent`(*name*, *db*)

Make sure the specified table does not exist

name The name of the table

db The name of the database file

`salt.states.sqlite3.table_present` (*name, db, schema, force=False*)

Make sure the specified table exists with the specified schema

name The name of the table

db The name of the database file

schema The dictionary containing the schema information

force If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

21.19.258 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user's SSH authorized key file can be easily controlled via the `ssh_auth` state. Defaults can be set by the `enc`, `options`, and `comment` keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```

AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

```

`salt.states.ssh_auth.absent` (*name, user, enc='ssh-rsa', comment=', source=', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None*)

Verifies that the specified SSH key is absent

name The SSH key to manage

user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
options The options passed to the key, pass a list object
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

Note: The default value of the `fingerprint_hash_type` will change to sha256 in Salt 2017.7.0.

`salt.states.ssh_auth.present`(*name, user, enc='ssh-rsa', comment=', source=', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs*)

Verifies that the specified SSH key is present for the specified user

name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
 2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
 3. Paste it into a new file.
-

options The options passed to the key, pass a list object
config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

Note: The default value of the `fingerprint_hash_type` will change to sha256 in Salt 2017.7.0.

21.19.259 salt.states.ssh_known_hosts

Control of SSH known_hosts entries

Manage the information stored in the known_hosts files.

```

github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48
    - fingerprint_hash_type: md5

example.com:
  ssh_known_hosts:
    - absent
    - user: root

```

`salt.states.ssh_known_hosts.absent` (*name*, *user=None*, *config=None*)

Verifies that the specified host is not known by the given user

name The host name Note that only single host names are supported. If `foo.example.com` and `bar.example.com` are the same machine and you need to exclude both, you will need one Salt state for each.

user The user who owns the ssh authorized keys file to modify

config The location of the authorized keys file relative to the user's home directory, defaults to `".ssh/known_hosts"`. If no user is specified, defaults to `"/etc/ssh/ssh_known_hosts"`. If present, must be an absolute path when a user is not specified.

```

salt.states.ssh_known_hosts.present (name, user=None, fingerprint=None,
                                     key=None, port=None, enc=None, config=None,
                                     hash_known_hosts=True, timeout=5, finger-
                                     print_hash_type=None)

```

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

name The name of the remote host (e.g. `"github.com"`) Note that only a single hostname is supported, if `foo.example.com` and `bar.example.com` have the same host you will need two separate Salt States to represent them.

user The user who owns the ssh authorized keys file to modify

fingerprint The fingerprint of the key which must be present in the `known_hosts` file (optional if key specified)

key The public key which must be present in the `known_hosts` file (optional if fingerprint specified)

port optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

enc Defines what type of key is being used, can be `ed25519`, `ecdsa ssh-rsa` or `ssh-dss`

config The location of the authorized keys file relative to the user's home directory, defaults to `".ssh/known_hosts"`. If no user is specified, defaults to `"/etc/ssh/ssh_known_hosts"`. If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

21.19.260 salt.states.stateconf

Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

`salt.states.stateconf.context`(*name*, ***kwargs*)
No-op state to support state config via the stateconf renderer.

`salt.states.stateconf.set`(*name*, ***kwargs*)
No-op state to support state config via the stateconf renderer.

21.19.261 salt.states.status

Minion status monitoring

Maps to the *status* execution module.

`salt.states.status.loadavg`(*name*, *maximum=None*, *minimum=None*)
Return the current load average for the specified minion. Available values for name are *1-min*, *5-min* and *15-min*. *minimum* and *maximum* values should be passed in as strings.

`salt.states.status.process`(*name*)
Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

21.19.262 salt.states.statuspage

StatusPage

Manage the [StatusPage](#) configuration.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

`salt.states.statuspage.create`(*name*, *endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Insert a new entry under a specific endpoint.

endpoint: incidents Insert under this specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

kwargs Other params.

SLS Example:

```
create-my-component:
  statuspage.create:
    - endpoint: components
    - name: my component
    - group_id: 993vgp1shj12
```

```
salt.states.statuspage.delete(name, endpoint='incidents', id=None, api_url=None,
                             page_id=None, api_key=None, api_version=None)
```

Remove an entry from an endpoint.

endpoint: incidents Request a specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
  statuspage.delete:
    - endpoint: components
    - id: ftgks51sfs2d
```

```
salt.states.statuspage.managed(name, config, api_url=None, page_id=None, api_key=None,
                              api_version=None, pace=1, allow_empty=False)
```

Manage the StatusPage configuration.

config Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

pace: 1 Max requests per second allowed by the API.

allow_empty: False Allow empty config.

SLS example:

```
my-statuspage-config:
  statuspage.managed:
    - config:
        components:
          - name: component1
            group_id: uy4g37rf
          - name: component2
            group_id: 3n4uyu4gf
        incidents:
          - name: incident1
            status: resolved
            impact: major
            backfilled: false
          - name: incident2
            status: investigating
            impact: minor
```

```
salt.states.statuspage.update(name, endpoint='incidents', id=None, api_url=None,
                             page_id=None, api_key=None, api_version=None, **kwargs)
```

Update attribute(s) of a specific endpoint.

id The unique ID of the endpoint entry.

endpoint: incidents Endpoint name.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```

update-my-incident:
  statuspage.update:
    - id: dz959yz2nd4l
    - status: resolved

```

21.19.263 salt.states.supervisord

Interaction with the Supervisor daemon

```

wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf

```

`salt.states.supervisord.dead`(*name*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is dead (not running).

name Service name as defined in the supervisor configuration file

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.mod_watch`(*name*, *restart=True*, *update=False*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

The supervisord watcher, called to invoke the watch command. Always restart on watch

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.supervisord.running`(*name*, *restart=False*, *update=False*, *user=None*, *conf_file=None*, *bin_env=None*, ***kwargs*)

Ensure the named service is running.

name Service name as defined in the supervisor configuration file

restart Whether to force a restart

update Whether to update the supervisor configuration.

user Name of the user to run the supervisorctl command

New in version 0.17.0.

conf_file path to supervisorctl config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

21.19.264 salt.states.svn

Manage SVN repositories

Manage repository checkouts via the `svn` vcs system. Note that subversion must be installed for these states to be available, so `svn` states should include a `requisite` to a `pkg.installed` state for the package which provides subversion (`subversion` in most cases). Example:

subversion:

pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:

svn.latest:- **target:** /tmp/swallow

salt.states.svn.dirty(*name, target, user=None, username=None, password=None, ignore_unversioned=False*)

Determine if the working directory has been changed.

salt.states.svn.export(*name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False, trust_failures=None*)

Export a file or directory from an SVN repository

name Address and path to the file or directory to be exported.

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable "force" if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

overwrite [False] Overwrite existing target

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's `-trust-server-cert`

trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if `trust=True` is not sufficient. The specified string is passed to SVN's `-trust-server-cert-failures` option as-is.

New in version 2019.2.0.

salt.states.svn.latest(*name, target=None, rev=None, user=None, username=None, password=None, force=False, externals=True, trust=False, trust_failures=None*)

Checkout or update the working directory to the latest revision from the remote repository.

name Address of the name repository as passed to "svn checkout"

target Name of the target directory where the checkout will put the working directory

rev [None] The name revision number to checkout. Enable "force" if the directory already exists.

user [None] Name of the user performing repository management operations

username [None] The user to access the name repository with. The svn default is the current user

password Connect to the Subversion server with this password

New in version 0.17.0.

force [False] Continue if conflicts are encountered

externals [True] Change to False to not checkout or update externals

trust [False] Automatically trust the remote server. SVN's `-trust-server-cert`

trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if `trust=True` is not sufficient. The specified string is passed to SVN's `-trust-server-cert-failures` option as-is.

New in version 2019.2.0.

21.19.265 salt.states.sysctl

Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

`salt.states.sysctl.present` (*name*, *value*, *config=None*)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is `/etc/sysctl.conf`

name The name of the sysctl value to edit

value The sysctl value to apply

config The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

21.19.266 salt.states.syslog_ng

State module for syslog_ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd, ps, syslog_ng

platform all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

Details

The service module is not available on all system, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see *syslog-ng state usage*.

Syslog-ng configuration file format

The syntax of a configuration snippet in `syslog-ng.conf`:

```
object_type object_id {<options>};
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: <http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5>

`salt.states.syslog_ng.config`(*name*, *config*, *write=True*)

Builds syslog-ng configuration.

name : the id of the Salt document
config : the parsed YAML code
write : if True, it writes the config into the configuration file, otherwise just returns it

`salt.states.syslog_ng.reloaded`(*name*)

Reloads syslog-ng.

`salt.states.syslog_ng.started`(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*, **args*, ***kwargs*)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

`salt.states.syslog_ng.stopped`(*name=None*)

Kills syslog-ng.

21.19.267 salt.states.sysrc

State to work with sysrc

`salt.states.sysrc.absent`(*name*, ***kwargs*)

Ensure a sysrc variable is absent.

name The variable name to set

file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

`salt.states.sysrc.managed`(*name*, *value*, ***kwargs*)

Ensure a sysrc variable is set to a specific value.

name The variable name to set

value Value to set the variable to

file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

Example:

```
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

21.19.268 salt.states.telemetry_alert

Manage Telemetry alert configurations

New in version 2016.3.0.

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```

ensure telemetry alert X is defined on deployment Y:
  telemetry_alert.present:
    - deployment_id: "rs-XXXXXX"
    - metric_name: "testMetric"
    - alert_config:
      max: 1
      filter: SERVER_ROLE_MONGOD_PRIMARY
      escalate_to: "example@pagerduty.com"
    - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"

```

`salt.states.telemetry_alert.absent`(*name*, *deployment_id*, *metric_name*, *api_key*=None, *profile*='telemetry')

Ensure the telemetry alert config is deleted

name An optional description of the alarms (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

api_key Telemetry api key for the user

profile A dict with telemetry config data. If present, will be used instead of `api_key`.

`salt.states.telemetry_alert.present`(*name*, *deployment_id*, *metric_name*, *alert_config*, *api_key*=None, *profile*='telemetry')

Ensure the telemetry alert exists.

name An optional description of the alarm (not currently supported by telemetry API)

deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied

alert_config: Is a list of dictionaries where each dict contains the following fields:

filter By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.

min the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.

max the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.

notify_all Used to indicate if you want to alert both onCallEngineer and apiNotifications

api_key Telemetry api key for the user

profile A dict of telemetry config information. If present, will be used instead of `api_key`.

21.19.269 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```

always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:

```

(continues on next page)

(continued from previous page)

```

test.fail_without_changes:
  - name: foo

always-changes-and-succeeds:
test.succeed_with_changes:
  - name: foo

always-changes-and-fails:
test.fail_with_changes:
  - name: foo

my-custom-combo:
test.configurable_test_state:
  - name: foo
  - changes: True
  - result: False
  - comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
test.check_pillar:
  - present:
    - foo
  - integer:
    - bar

```

`salt.states.test.check_pillar` (*name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False*)
 Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```

is-pillar-foo-present-and-bar-is-int:
test.check_pillar:
  - present:
    - foo
  - integer:
    - bar

```

`salt.states.test.configurable_test_state` (*name, changes=True, result=True, comment=""*)
 A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.

name: A unique string.

changes: Do we return anything in the changes field? Accepts True, False, and 'Random' Default is True

result: Do we return successfully or not? Accepts True, False, and 'Random' Default is True If test is True and changes is True, this will be None. If test is True and changes is False, this will be True.

comment: String to fill the comment field with. Default is ""

`salt.states.test.fail_with_changes` (*name, **kwargs*)
 Returns failure and changes is not empty.

New in version 2014.7.0.

name: A unique string.

`salt.states.test.fail_without_changes` (*name, **kwargs*)
 Returns failure.

New in version 2014.7.0.

name: A unique string.

`salt.states.test.mod_watch(name, sfun=None, **kwargs)`

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```

this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes

```

`salt.states.test.nop(name, **kwargs)`

A no-op state that does nothing. Useful in conjunction with the *use* requisite, or in templates which could otherwise be empty due to jinja rendering

New in version 2015.8.1.

`salt.states.test.show_notification(name, text=None, **kwargs)`

Simple notification using text argument.

New in version 2015.8.0.

name A unique string.

text Text to return in the comment.

`salt.states.test.succeed_with_changes(name, **kwargs)`

Returns successful and changes is not empty

New in version 2014.7.0.

name: A unique string.

`salt.states.test.succeed_without_changes(name, **kwargs)`

Returns successful.

New in version 2014.7.0.

name A unique string.

21.19.270 salt.states.testinframod module

21.19.271 salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

`salt.states.timezone.system` (*name*, *utc=True*)

Set the timezone for the system.

name The name of the timezone to use (e.g.: America/Denver)

utc Whether or not to set the hardware clock to UTC (default is True)

21.19.272 salt.states.tls

Enforce state for SSL/TLS

`salt.states.tls.valid_certificate` (*name*, *weeks=0*, *days=0*, *hours=0*, *minutes=0*, *seconds=0*)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

21.19.273 salt.states.tomcat

Manage Apache Tomcat web applications

Note: This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```

Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 1: conf/tomcat-users.xml

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access

- Last tested on:

Tomcat Version: Apache Tomcat/7.0.54

JVM Vendor: Oracle Corporation

JVM Version: 1.8.0_101-b13

OS Architecture: amd64

OS Name: Linux

OS Version: 3.10.0-327.22.2.el7.x86_64

`salt.states.tomcat.mod_watch` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.tomcat.undeployed` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Enforce that the WAR will be undeployed from the server

name The context path to undeploy.

url [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

`salt.states.tomcat.wait` (*name*, *url*='http://localhost:8080/manager', *timeout*=180)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the `tomcat.war_deployed` state to make sure tomcat is running and that the manager is running as well and ready for deployment.

url [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

`salt.states.tomcat.war_deployed`(*name*, *war*, *force=False*, *url='http://localhost:8080/manager'*, *timeout=180*, *temp_war_location=None*, *version=True*)

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

Note: For more info about Tomcats file paths and context naming, please see <http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming>

name The context path to deploy (incl. forward slash) the WAR to.

war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

force [False] Force deployment even if the version strings are the same. Disabled by default.

url [<http://localhost:8080/manager>] The URL of the Tomcat Web Application Manager.

timeout [180] Timeout for HTTP requests to the Tomcat Manager.

temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

version [?] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-jenkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```

Note: Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set `version` to `False`.

21.19.274 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

`salt.states.trafficserver.bounce_cluster`(*name*)

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

`salt.states.trafficserver.bounce_local`(*name*, *drain=False*)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

`salt.states.trafficserver.clear_cluster`(*name*)

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
  trafficserver.clear_cluster
```

`salt.states.trafficserver.clear_node`(*name*)

Clears accumulated statistics on the local node.

```
clear_ats_node:
  trafficserver.clear_node
```

`salt.states.trafficserver.config`(*name*, *value*)

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
trafficserver.config:
  - value: cdn.site.domain.tld
```

OR

```
traffic_server_setting:
```

(continues on next page)

(continued from previous page)

```

trafficserver.config:
- name: proxy.config.proxy_name
- value: cdn.site.domain.tld

```

`salt.states.trafficserver.offline`(*name*, *path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```

offline_ats_path:
trafficserver.offline:
- path: /path/to/cache

```

`salt.states.trafficserver.refresh`(*name*)

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```

refresh_ats:
trafficserver.refresh

```

`salt.states.trafficserver.restart_cluster`(*name*)

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```

restart_ats_cluster:
trafficserver.restart_cluster

```

`salt.states.trafficserver.restart_local`(*name*, *drain=False*)

Restart the `traffic_manager` and `traffic_server` processes on the local node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```

restart_ats_local:
trafficserver.restart_local

restart_ats_local_drain:
trafficserver.restart_local
- drain: True

```

`salt.states.trafficserver.shutdown`(*name*)

Shut down Traffic Server on the local node.

```

shutdown_ats:
trafficserver.shutdown

```

`salt.states.trafficserver.startup`(*name*)

Start Traffic Server on the local node.

```

startup_ats:
trafficserver.startup

```

`salt.states.trafficserver.zero_cluster(name)`
Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

`salt.states.trafficserver.zero_node(name)`
Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

21.19.275 salt.states.tuned

Interface to Red Hat tuned-adm module

```
maintainer Syed Ali <alicsyed@gmail.com>
maturity new
depends cmd.run
platform Linux
```

`salt.states.tuned.off(name=None)`
Turns 'tuned' off. Example tuned.sls file for turning tuned off:
`tuned: tuned.off: []`
To see a valid list of states call execution module: `tuned.list`

`salt.states.tuned.profile(name)`
This state module allows you to modify system tuned parameters
Example tuned.sls file to set profile to virtual-guest
`tuned:`
 `tuned:`

- profile
- name: virtual-guest

`name` tuned profile name to set the system to
To see a valid list of states call execution module: `tuned.list`

21.19.276 salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

`salt.states.uptime.monitored(name, **params)`

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

21.19.277 salt.states.user

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

`salt.states.user.absent(name, purge=False, force=False)`

Ensure that the named user is absent

name The name of the user to remove

purge Set purge to True to delete all of the user's files as well as the user, Default is False.

force If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is False.

`salt.states.user.present(name, uid=None, gid=None, gid_from_name=False, groups=None, optional_groups=None, remove_groups=True, home=None, createhome=True, password=None, hash_password=False, enforce_password=True, empty_password=False, shell=None, unique=True, system=False, full_name=None, roomnumber=None, workphone=None, homephone=None, other=None, loginclass=None, date=None, mindays=None, maxdays=None, inactdays=None, warndays=None, expire=None, win_homedrive=None, win_profile=None, win_logonscript=None, win_description=None, nologinit=False, allow_uid_change=False, allow_gid_change=False)`

Ensure that the named user is present with the specified properties

name The name of the user to manage

uid The user id to assign. If not specified, and the user does not exist, then the next available uid will be assigned.

gid The id of the default group to assign to the user. Either a group name or gid can be used. If not specified, and the user does not exist, then the next available gid will be assigned.

gid_from_name [False] If `True`, the default group id will be set to the id of the group with the same name as the user. If the group does not exist the state will fail.

allow_uid_change [False] Set to `True` to allow the state to update the uid.

New in version 2018.3.1.

allow_gid_change [False] Set to `True` to allow the state to update the gid.

New in version 2018.3.1.

groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

optional_groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both "groups" and "optional_groups", then it will be assumed to be required and not optional.

remove_groups Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

home The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if `createhome` is set to `True`.

createhome [True] If set to `False`, the home directory will not be created if it doesn't already exist.

Warning: Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for `home` must already exist.

nologinit [False] If set to `True`, it will not add the user to lastlog and faillog databases.

Note: Not supported on Windows or Mac OS.

password A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

Changed in version 0.16.0: BSD support added.

hash_password Set to `True` to hash the clear text password. Default is `False`.

enforce_password Set to `False` to keep the password from being changed if it has already been set and the password hash differs from what is specified in the "password" field. This option will be ignored if "password" is not specified, Default is `True`.

empty_password Set to `True` to enable password-less login for user, Default is `False`.

shell The login shell, defaults to the system default shell

unique Require a unique UID, Default is `True`.

system Choose UID in the range of `FIRST_SYSTEM_UID` and `LAST_SYSTEM_UID`, Default is `False`.

loginclass The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname The user's full name

roomnumber The user's room number (not supported in MacOS)

workphone The user's work phone number (not supported in MacOS)

homephone The user's home phone number (not supported in MacOS)

other The user's other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of 'em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date Date of last change of password, represented in days since epoch (January 1, 1970).

mindays The minimum number of days between password changes.

maxdays The maximum number of days between password changes.

inactdays The number of days after a password expires before an account is locked.

warndays Number of days prior to maxdays to warn users.

expire Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

win_homedrive (Windows Only) The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: - win_homedrive: 'U:

Changed in version 2015.8.0.

win_profile (Windows Only) The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only) The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only) A brief description of the purpose of the users account.

Changed in version 2015.8.0.

21.19.278 salt.states.vagrant

Manage Vagrant VMs

Manange execution of Vagrant virtual machines on Salt minions.

Vagrant is a tool for building and managing virtual machine environments. It can use various providers, such as [VirtualBox](#), [Docker](#), or [VMware](#), to run its VMs. Vagrant provides some of the functionality of a light-weight hypervisor. The combination of Salt modules, Vagrant running on the host, and a virtual machine provider, gives hypervisor-like functionality for developers who use Vagrant to quickly define their virtual environments.

New in version 2018.3.0.

The configuration of each virtual machine is defined in a file named `Vagrantfile` which must exist on the VM host machine. The essential parameters which must be defined to start a Vagrant VM are the directory where the `Vagrantfile` is located (argument `cwd`), and the username which will own the Vagrant `box` created for the VM (argument `vagrant_runas`).

A single `Vagrantfile` may define one or more virtual machines. Use the `machine` argument to chose among them. The default (blank) value will select the `primary` (or `only`) machine in the `Vagrantfile`.

[NOTE:] Each virtual machine host must have the following:

- a working salt-minion
- a Salt sdb database configured for `vagrant_sdb_data`.
- Vagrant installed and the `vagrant` command working
- a suitable VM provider

```
# EXAMPLE:
# file /etc/salt/minion.d/vagrant_sdb.conf on the host computer
# -- this sdb database is required by the Vagrant module --
vagrant_sdb_data: # The sdb database must have this name.
  driver: sqlite3 # Let's use SQLite to store the data ...
  database: /var/cache/salt/vagrant.sqlite # ... in this file ...
  table: sdb # ... using this table name.
  create_table: True # if not present
```

`salt.states.vagrant.destroyed(name)`

Stops a VM (or VMs) and removes all references to it (them). (Runs `vagrant destroy`.)

Subsequent re-use of the same machine will require another operation of `vagrant.running` or a call to the `vagrant.init` execution module.

Parameters `name` – May be a `Salt_id` node or a POSIX-style wildcard string.

```
node_name:
  vagrant.destroyed
```

`salt.states.vagrant.initialized(name, **kwargs)`

Defines a new VM with specified arguments, but does not start it.

Parameters `name` – the `Salt_id` node name you wish your VM to have.

Each machine must be initialized individually using this function or the "vagrant.running" function, or the `vagrant.init` execution module call.

This command will not change the state of a running or paused machine.

Possible keyword arguments:

- `cwd`: The directory (path) containing the Vagrantfile
- `machine`: (") the name of the machine (in the Vagrantfile) if not default
- `vagrant_runas`: ('root') the username who owns the vagrantbox file
- `vagrant_provider`: the provider to run the VM (usually 'virtualbox')
- `vm`: ({} a dictionary containing these or other keyword arguments

```
node_name1:
  vagrant.initialized
  - cwd: /projects/my_project
  - vagrant_runas: my_username
  - machine: machine1

node_name2:
  vagrant.initialized
  - cwd: /projects/my_project
  - vagrant_runas: my_username
  - machine: machine2

start_nodes:
  vagrant.start:
    - name: node_name?
```

`salt.states.vagrant.paused(name)`

Stores the state of a VM (or VMs) for fast restart. (Runs `vagrant suspend`.)

Parameters `name` – May be a `Salt_id` node or a POSIX-style wildcard string.

```
node_name:
  vagrant.paused
```

`salt.states.vagrant.powered_off(name)`

Stops a VM (or VMs) by power off. (Runs `vagrant halt`.)

This method is provided for compatibility with other VM-control state modules. For Vagrant, the action is identical with `stopped`.

Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.unpowered
```

`salt.states.vagrant.rebooted(name)`

Reboots a running, paused, or stopped VM (or VMs). (Runs `vagrant reload`.)

The will re-run the provisioning

Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

```
node_name:
  vagrant.reloaded
```

`salt.states.vagrant.running(name, **kwargs)`

Defines and starts a new VM with specified arguments, or restart a VM (or group of VMs). (Runs `vagrant up`.)

Parameters name – the Salt_id node name you wish your VM to have.

If `name` contains a `"?"` or `"**"` then it will re-start a group of VMs which have been paused or stopped.

Each machine must be initially started individually using this function or the `vagrant.init` execution module call.

[NOTE:] Keyword arguments are silently ignored when re-starting an existing VM.

Possible keyword arguments:

- `cwd`: The directory (path) containing the Vagrantfile
- `machine`: (") the name of the machine (in the Vagrantfile) if not default
- `vagrant_runas`: ('root') the username who owns the vagrantbox file
- `vagrant_provider`: the provider to run the VM (usually 'virtualbox')
- `vm`: ({} a dictionary containing these or other keyword arguments

```
node_name:
  vagrant.running
```

```
node_name:
  vagrant.running:
    - cwd: /projects/my_project
    - vagrant_runas: my_username
    - machine: machine1
```

`salt.states.vagrant.stopped(name)`

Stops a VM (or VMs) by shutting it (them) down nicely. (Runs `vagrant halt`)

Parameters name – May be a Salt_id node, or a POSIX-style wildcard string.

```
node_name:
  vagrant.stopped
```

21.19.279 salt.states.vault module

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.

maintainer SaltStack

maturity new

platform all

New in version 2017.7.0.

`salt.states.vault.policy_present`(*name*, *rules*)

Ensure a Vault policy with the given name and rules is present.

name The name of the policy

rules Rules formatted as in-line HCL

```
demo-policy:
  vault.policy_present:
    - name: foo/bar
    - rules: |
        path "secret/top-secret/*" {
            policy = "deny"
        }
        path "secret/not-very-secret/*" {
            policy = "write"
        }
```

21.19.280 salt.states.vbox_guest

VirtualBox Guest Additions installer state

`salt.states.vbox_guest.additions_installed`(*name*, *reboot=False*, *upgrade_os=False*)

Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

name The name has no functional value and is only used as a tracking reference.

reboot [False] Restart OS to complete installation.

upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

`salt.states.vbox_guest.additions_removed`(*name*, *force=False*)

Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

name The name has no functional value and is only used as a tracking reference.

force Force VirtualBox Guest Additions removing.

`salt.states.vbox_guest.grant_access_to_shared_folders_to`(*name*, *users=None*)

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*.

name Name of the user to grant access to auto-mounted shared folders to.

users List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

21.19.281 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```

webserver-warning-message:
victorops.create_event:
- message_type: 'CRITICAL'
- entity_id: 'webserver/diskspace'
- state_message: 'Webserver diskspace is low.'

```

`salt.states.victorops.create_event`(*name*, *message_type*, *routing_key*=*'everyone'*, ***kwargs*)
 Create an event on the VictorOps service

```

webserver-warning-message:
victorops.create_event:
- message_type: 'CRITICAL'
- entity_id: 'webserver/diskspace'
- state_message: 'Webserver diskspace is low.'

database-server-warning-message:
victorops.create_event:
- message_type: 'WARNING'
- entity_id: 'db_server/load'
- state_message: 'Database Server load is high.'
- entity_is_host: True
- entity_display_name: 'dbserver.example.com'

```

The following parameters are required:

name This is a short description of the event.

message_type One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

routing_key The key for where messages should be routed. By default, sent to *'everyone'* route.

entity_id The name of alerting entity. If not provided, a random name will be assigned.

timestamp Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

timestamp_fmt The date format for the timestamp parameter. Defaults to *"%Y-%m-%dT%H:%M:%S"*.

state_start_time The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

state_start_time_fmt The date format for the timestamp parameter. Defaults to *"%Y-%m-%dT%H:%M:%S"*.

state_message Any additional status information from the alert item.

entity_is_host Used within VictorOps to select the appropriate display format for the incident.

entity_display_name Used within VictorOps to display a human-readable name for the entity.

ack_message A user entered comment for the acknowledgment.

ack_author The user that acknowledged the incident.

21.19.282 salt.states.virt module

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```

libvirt_keys:
  virt.keys

```

`salt.states.virt.keys` (*name*, *basepath*='/etc/pki', ***kwargs*)

Manage libvirt keys.

name The name variable used to track the execution

basepath Defaults to `/etc/pki`, this is the root location used for libvirt keys on the hypervisor

The following parameters are optional:

country The country that the certificate should use. Defaults to US.

New in version 2018.3.0.

state The state that the certificate should use. Defaults to Utah.

New in version 2018.3.0.

locality The locality that the certificate should use. Defaults to Salt Lake City.

New in version 2018.3.0.

organization The organization that the certificate should use. Defaults to Salted.

New in version 2018.3.0.

expiration_days The number of days that the certificate should be valid for. Defaults to 365 days (1 year)

New in version 2018.3.0.

`salt.states.virt.network_running` (*name*, *bridge*, *forward*, *vport*=None, *tag*=None, *autostart*=True, *connection*=None, *username*=None, *password*=None)

Defines and starts a new network with specified arguments.

Parameters

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

domain_name:

```
virt.network_define
```

network_name:

virt.network_define:

- **bridge:** main
- **forward:** bridge
- **vport:** openvswitch
- **tag:** 180
- **autostart:** True

`salt.states.virt.pool_running` (*name*, *ptype*=None, *target*=None, *permissions*=None, *source*=None, *transient*=False, *autostart*=True, *connection*=None, *username*=None, *password*=None)

Defines and starts a new pool with specified arguments.

New in version 2019.2.0.

Parameters

- **ptype** – libvirt pool type
- **target** – full path to the target device or folder. (Default: None)
- **permissions** – target permissions. See [Permissions definition](#) for more details on this structure.
- **source** – dictionary containing keys matching the `source_*` parameters in function `salt.modules.virt.pool_define()`.
- **transient** – when set to True, the pool will be automatically undefined after being stopped. (Default: False)

- **autostart** – Whether to start the pool when booting the host. (Default: True)
- **start** – When True, define and start the pool, otherwise the pool will be left stopped.
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

```
pool_name:
  virt.pool_define
```

```
pool_name:
  virt.pool_define:
    - ptype: netfs
    - target: /mnt/cifs
    - permissions:
      - mode: 0770
      - owner: 1000
      - group: 100
    - source:
      - dir: samba_share
      - hosts:
        one.example.com
        two.example.com
      - format: cifs
    - autostart: True
```

`salt.states.virt.powered_off`(*name*, *connection=None*, *username=None*, *password=None*)
Stops a VM by power off.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
New in version 2019.2.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.rebooted`(*name*, *connection=None*, *username=None*, *password=None*)
Reboots VMs

New in version 2016.3.0.

Parameters

- **name** –
- **connection** – libvirt connection URI, overriding defaults
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
New in version 2019.2.0.

`salt.states.virt.reverted`(*name*, *snapshot=None*, *cleanup=False*)

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```

domain_name:
  virt.reverted:
    - cleanup: True

domain_name_1:
  virt.reverted:
    - snapshot: snapshot_name
    - cleanup: False

```

`salt.states.virt.running`(*name*, *cpu=None*, *mem=None*, *image=None*, *vm_type=None*, *disk_profile=None*, *disks=None*, *nic_profile=None*, *interfaces=None*, *graphics=None*, *seed=True*, *install=True*, *pub_key=None*, *priv_key=None*, *update=False*, *connection=None*, *username=None*, *password=None*, *os_type=None*, *arch=None*)

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

Parameters

- **name** – name of the virtual machine to run
- **cpu** – number of CPUs for the virtual machine to create
- **mem** – amount of memory in MiB for the new virtual machine
- **image** – disk image to use for the first disk of the new VM

Deprecated since version 2019.2.0.

- **vm_type** – force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use 'qemu' type instead of the 'kvm' one.

New in version 2019.2.0.

- **disk_profile** – Name of the disk profile to use for the new virtual machine

New in version 2019.2.0.

- **disks** – List of disk to create for the new virtual machine. See [Disks Definitions](#) for more details on the items on this list.

New in version 2019.2.0.

- **nic_profile** – Name of the network interfaces profile to use for the new virtual machine

New in version 2019.2.0.

- **interfaces** – List of network interfaces to create for the new virtual machine. See [Network Interfaces Definitions](#) for more details on the items on this list.

New in version 2019.2.0.

- **graphics** – Graphics device to create for the new virtual machine. See [Graphics Definition](#) for more details on this dictionary

New in version 2019.2.0.

- **saltenv** – Fileserver environment (Default: 'base'). See [cp module for more details](#)

New in version 2019.2.0.

- **seed** –

True to seed the disk image. Only used when the **image** parameter is provided.
(Default: True)

New in version 2019.2.0.

- **install** – install salt minion if absent (Default: True)

New in version 2019.2.0.

- **pub_key** – public key to seed with (Default: None)

New in version 2019.2.0.

- **priv_key** – public key to seed with (Default: None)

New in version 2019.2.0.

- **seed_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')

New in version 2019.2.0.

- **update** – set to True to update a defined module. (Default: False)

New in version 2019.2.0.

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

- **os_type** – type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm. Only used when creating a new virtual machine.

New in version Neon.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is preferred over `i686`. Only used when creating a new virtual machine.

New in version Neon.

Example States

Make sure an already-defined virtual machine called `domain_name` is running:

```
domain_name:
  virt.running
```

Do the same, but define the virtual machine if needed:

```
domain_name:
  virt.running:
    - cpu: 2
    - mem: 2048
    - disk_profile: prod
    - disks:
      - name: system
        size: 8192
        overlay_image: True
        pool: default
        image: /path/to/image.qcow2
```

(continues on next page)

(continued from previous page)

```

- name: data
  size: 16834
- nic_profile: prod
- interfaces:
  - name: eth0
    mac: 01:23:45:67:89:AB
  - name: eth1
    type: network
    source: admin
- graphics:
  - type: spice
    listen:
      - type: address
        address: 192.168.0.125

```

`salt.states.virt.saved`(*name*, *suffix=None*)

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```

domain_name:
  virt.saved:
    - suffix: periodic

domain*:
  virt.saved:
    - suffix: periodic

```

`salt.states.virt.snapshot`(*name*, *suffix=None*, *connection=None*, *username=None*, *password=None*)

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
New in version 2019.2.0.

```

domain_name:
  virt.snapshot:
    - suffix: periodic

domain*:
  virt.snapshot:
    - suffix: periodic

```

`salt.states.virt.stopped`(*name*, *connection=None*, *username=None*, *password=None*)

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
New in version 2019.2.0.

```
domain_name:
  virt.stopped
```

`salt.states.virt.unpowered(name)`

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
  virt.stopped
```

21.19.283 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

```
salt.states.virtualenv_mod.managed(name,
                                   venv_bin=None,
                                   requirements=None,
                                   system_site_packages=False,
                                   distribute=False,
                                   use_wheel=False,
                                   clear=False,
                                   python=None,
                                   extra_search_dir=None,
                                   never_download=None,
                                   prompt=None,
                                   user=None,
                                   cwd=None,
                                   index_url=None,
                                   extra_index_url=None,
                                   pre_releases=False,
                                   no_deps=False,
                                   pip_download=None,
                                   pip_download_cache=None,
                                   pip_exists_action=None,
                                   pip_ignore_installed=False,
                                   proxy=None,
                                   use_vt=False,
                                   env_vars=None,
                                   no_use_wheel=False,
                                   pip_upgrade=False,
                                   pip_pkgs=None,
                                   pip_no_cache_dir=False,
                                   pip_cache_dir=None,
                                   process_dependency_links=False,
                                   no_binary=None,
                                   **kwargs)
```

Create a virtualenv and optionally manage it with pip

name Path to the virtualenv.

venv_bin: virtualenv The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

requirements: None Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

use_wheel: False Prefer wheel archives (requires pip >= 1.4).

python [None] Python executable used to build the virtualenv

user: None The user under which to run virtualenv and pip.

cwd: None Path to the working directory where `pip install` is executed.

no_deps: False Pass `-no-deps` to `pip install`.

pip_exists_action: None Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

proxy: None Proxy address which is passed to `pip install`.

env_vars: None Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling.

no_use_wheel: False Force to not use wheel archives (requires pip>=1.4)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

pip_upgrade: False Pass `-upgrade` to `pip install`.

pip_pkgs: None As an alternative to `requirements`, pass a list of pip packages that should be installed.

process_dependency_links: False Run pip install with the `-process_dependency_links` flag.

New in version 2017.7.0.

Also accepts any kwargs that the `virtualenv` module will. However, some kwargs, such as the `pip` option, require `- distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
      PATH_VAR: '/usr/local/bin/'
```

21.19.284 salt.states.webutil

Support for `htpasswd` module. Requires the `apache2-utils` package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

`salt.states.webutil.user_absent` (*name*, *htpasswd_file=None*, *runas=None*)

Make sure the user is not in the specified `htpasswd` file

name User name

htpasswd_file Path to the `htpasswd` file

runas The system user to run `htpasswd` command with

`salt.states.webutil.user_exists` (*name*, *password=None*, *htpasswd_file=None*, *options=""*, *force=False*, *runas=None*, *update=False*)

Make sure the user is inside the specified `htpasswd` file

name User name

password User password

htpasswd_file Path to the `htpasswd` file

options See `salt.modules.htpasswd.useradd`

force Touch the file even if user already created

runas The system user to run `htpasswd` command with

update Update an existing user's password if it's different from what's in the `htpasswd` file (unlike `force`, which updates regardless)

21.19.285 salt.states.win_certutil module

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher
```

`salt.states.win_certutil.add_store` (*name*, *store*, *saltenv='base'*)
 Store a certificate to the given store
name The certificate to store, this can use local paths or salt:// paths
store The store to add the certificate to
saltenv The salt environment to use, this is ignored if a local path is specified

`salt.states.win_certutil.del_store` (*name*, *store*, *saltenv='base'*)
 Remove a certificate in the given store
name The certificate to remove, this can use local paths or salt:// paths
store The store to remove the certificate from
saltenv The salt environment to use, this is ignored if a local path is specified

21.19.286 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

parameters: *name* - the path of the object *objectType* - Registry/File/Directory *user* - user account or SID for the ace *permission* - permission for the ace (see module win_acl for available permissions for each *objectType*) *acetype* - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

parameters: *name* - the path of the object *objectType* - Registry/File/Directory *user* - user account or SID for the ace *permission* - permission for the ace (see module win_acl for available permissions for each *objectType*) *acetype* - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
removeAcl:
  win_dacl.absent:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an object is inheriting permissions

parameters: *name* - the path of the object *objectType* - Registry/File/Directory *clear_existing_acl* - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```

eInherit:
  win_dacl.enableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - clear_existing_acl: True

```

Ensure an object is not inheriting permissions

parameters: *name* - the path of the object *objectType* - Registry/File/Directory *copy_inherited_acl* - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```

dInherit:
  win_dacl.disableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - copy_inherited_acl: False

```

`salt.states.win_dacl.absent`(*name, objectType, user, permission, acetype, propagation*)
Ensure an ACL does not exist

`salt.states.win_dacl.disinherit`(*name, objectType, copy_inherited_acl=True*)
Ensure an object is not inheriting ACLs from its parent

`salt.states.win_dacl.inherit`(*name, objectType, clear_existing_acl=False*)
Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.present`(*name, objectType, user, permission, acetype, propagation*)
Ensure an ACE is present

21.19.287 salt.states.win_dism module

Installing of Windows features using DISM

Install windows features/capabilities with DISM

```

Language.Basic~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed

```

`salt.states.win_dism.capability_installed`(*name, source=None, limit_access=False, image=None, restart=False*)

Install a DISM capability

Parameters

- **name** (*str*) - The capability to install
- **source** (*str*) - The optional source of the capability
- **limit_access** (*bool*) - Prevent DISM from contacting Windows Update for on-line images
- **image** (*Optional[str]*) - The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) - Reboot the machine if required by the install

Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.capability_removed`(*name*, *image=None*, *restart=False*)

Uninstall a DISM capability

Parameters

- **name** (*str*) – The capability to uninstall
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.feature_installed`(*name*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a DISM feature

Parameters

- **name** (*str*) – The feature in which to install
- **package** (*Optional[str]*) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use *package* to specify the parent package of the feature
- **source** (*str*) – The optional source of the feature
- **limit_access** (*bool*) – Prevent DISM from contacting Windows Update for on-line images
- **enable_parent** (*Optional[bool]*) – True will enable all parent features of the specified feature
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None,
                                     restart=False)
```

Disables a feature.

Parameters

- **name** (*str*) – The feature to disable
- **remove_payload** (*Optional[bool]*) – Remove the feature’s payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

```
salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False,
                                       image=None, restart=False)
```

Install a package.

Parameters

- **name** (*str*) – The package to install. Can be a `.cab` file, a `.msu` file, or a folder
- **ignore_check** (*Optional[bool]*) – Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) – Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

```
salt.states.win_dism.package_removed(name, image=None, restart=False)
```

Uninstall a package

Parameters

- **name** (*str*) – The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

21.19.288 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.dns_dhcp` (*name*, *interface*='Local Area Connection')

Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.dns_exists` (*name*, *servers*=None, *interface*='Local Area Connection', *replace*=False)

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list, default is 
    ↪ False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

`salt.states.win_dns_client.primary_suffix` (*name*, *suffix*=None, *updates*=False)

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

suffix [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

updates [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
  win_dns_client.primary_suffix:
    - suffix: sub.domain.tld
    - updates: True
```

21.19.289 salt.states.win_firewall

State for configuring Windows Firewall

`salt.states.win_firewall.add_rule` (*name*, *localport*, *protocol*='tcp', *action*='allow', *dir*='in', *remoteip*='any')

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) – The name of the rule. Must be unique and cannot be "all". Required.

- **localport** (*int*) – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) – The protocol. Can be any of the following:
 - A number between 0 and 255
 - icmpv4
 - icmpv6
 - tcp
 - udp
 - any
- **action** (*Optional[str]*) – The action the rule performs. Can be any of the following:
 - allow
 - block
 - bypass
- **dir** (*Optional[str]*) – The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) – The remote IP. Can be any of the following:
 - any
 - localsubnet
 - dns
 - dhcp
 - wins
 - defaultgateway
 - Any valid IPv4 address (192.168.0.12)
 - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
 - Any valid subnet (192.168.1.0/24)
 - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
 - A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

`salt.states.win_firewall.disabled` (*name='allprofiles'*)

Disable all the firewall profiles (Windows only)

Parameters **profile** (*Optional[str]*) – The name of the profile to disable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

Example:

```
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
```

(continues on next page)

(continued from previous page)

```

disable_all:
  win_firewall.disabled:
    - name: allprofiles

```

`salt.states.win_firewall.enabled` (*name='allprofiles'*)

Enable all the firewall profiles (Windows only)

Parameters **profile** (*Optional[str]*) – The name of the profile to enable. Default is allprofiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```

# To enable the domain profile
enable_domain:
  win_firewall.enabled:
    - name: domainprofile

# To enable all profiles
enable_all:
  win_firewall.enabled:
    - name: allprofiles

```

21.19.290 salt.states.win_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

`salt.states.win_iis.container_setting` (*name, container, settings=None*)

Set the value of the setting for an IIS container.

Parameters

- **name** (*str*) – The name of the IIS container.
- **container** (*str*) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) – A dictionary of the setting names and their values. Example of usage for the AppPools container:

```

site0-apppool-setting:
  win_iis.container_setting:
    - name: site0
    - container: AppPools
    - settings:
      managedPipelineMode: Integrated
      processModel.maxProcesses: 1
      processModel.userName: TestUser
      processModel.password: TestPassword
      processModel.identityType: SpecificUser

```

Example of usage for the Sites container:

```

site0-site-setting:
  win_iis.container_setting:
    - name: site0
    - container: Sites
    - settings:
      logFile.logFormat: W3C
      logFile.period: Daily
      limits.maxUrlSegments: 32

```

`salt.states.win_iis.create_app`(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **apppool** (*str*) – The name of the IIS application pool.

Example of usage with only the required arguments:

```

site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1

```

Example of usage specifying all available arguments:

```

site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
    - apppool: site0

```

`salt.states.win_iis.create_apppool`(*name*)

Create an IIS application pool.

Parameters **name** (*str*) – The name of the IIS application pool.

Usage:

```

site0-apppool:
  win_iis.create_apppool:
    - name: site0

```

`salt.states.win_iis.create_binding`(*name*, *site*, *hostheader=""*, *ipaddress=""*, *port=80*, *protocol='http'*, *sslflags=0*)

Create an IIS binding.

Parameters

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.
- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```

site0-https-binding:
  win_iis.create_binding:

```

(continues on next page)

(continued from previous page)

```
- site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
win_iis.create_binding:
- site: site0
- hostheader: site0.local
- ipaddress: '*'
- port: 443
- protocol: https
- sslflags: 0
```

```
salt.states.win_iis.create_cert_binding(name, site, hostheader=", ipaddress='*', port=443,
sslflags=0)
```

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **sslflags** (*str*) – Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
win_iis.create_cert_binding:
- name: 9988776655443322111000AAABBBCCDDDEEEFFF
- site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
win_iis.create_cert_binding:
- name: 9988776655443322111000AAABBBCCDDDEEEFFF
- site: site0
- hostheader: site0.local
- ipaddress: 192.168.1.199
- port: 443
- sslflags: 1
```

New in version 2016.11.0.

```
salt.states.win_iis.create_vdir(name, site, sourcepath, app='')
```

Create an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **app** (*str*) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
win_iis.create_vdir:
```

(continues on next page)

(continued from previous page)

```
- name: foo
- site: site0
- sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
    - app: v1
```

```
salt.states.win_iis.deployed(name, sourcepath, apppool=", hostheader=", ipaddress="'*', port=80,
                             protocol='http')
```

Ensure the website has been deployed.

Parameters

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcepath: C:\inetpub\site0
    - apppool: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
    - protocol: https
```

```
salt.states.win_iis.remove_app(name, site)
```

Remove an IIS application.

Parameters

- **name** (*str*) – The application name.
- **site** (*str*) – The IIS site name.

Usage:

```
site0-v1-app-remove:
  win_iis.remove_app:
    - name: v1
    - site: site0
```

`salt.states.win_iis.remove_appool(name)`

Remove an IIS application pool.

Parameters **name** (*str*) – The name of the IIS application pool.

Usage:

```
defaultappool-remove:
  win_iis.remove_appool:
    - name: DefaultAppPool
```

`salt.states.win_iis.remove_binding(name, site, hostheader=", ipaddress='*', port=80)`

Remove an IIS binding.

Parameters

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
    - hostheader: site0.local
    - ipaddress: '*'
    - port: 443
```

`salt.states.win_iis.remove_cert_binding(name, site, hostheader=", ipaddress='*', port=443)`

Remove a certificate from an IIS binding.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*str*) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
  win_iis.remove_cert_binding:
    - name: 9988776655443322111000AAABBBCCDDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
```

New in version 2016.11.0.

`salt.states.win_iis.remove_site(name)`

Delete a website from IIS.

Parameters **name** (*str*) – The IIS site name.

Usage:

```
defaultwebsite-remove:
  win_iis.remove_site:
    - name: Default Web Site
```

`salt.states.win_iis.remove_vdir(name, site, app='/')`

Remove an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **app** (*str*) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
    - app: v1
```

`salt.states.win_iis.set_app(name, site, settings=None)`

New in version 2017.7.0.

Set the value of the setting for an IIS web application.

Note: This function only configures existing app. Params are case sensitive.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **settings** (*str*) – A dictionary of the setting names and their values.

Available settings:

- `physicalPath` - The physical path of the webapp
- `applicationPool` - The application pool for the webapp
- `userName` "connectAs" user
- `password` "connectAs" password for user

Return type `bool`

Example of usage:

```
site0-webapp-setting:
  win_iis.set_app:
    - name: app0
    - site: Default Web Site
```

(continues on next page)

(continued from previous page)

```
- settings:
  userName: domain\user
  password: pass
  physicalPath: c:\inetpub\wwwroot
  applicationPool: appPool0
```

21.19.291 salt.states.win_lgpo module

Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

```
Ensure Account Lockout Duration:
lgpo.set:
- name: Account lockout duration
- setting: 90
- policy_class: Machine
```

```
Account lockout duration:
gpo.set:
- setting: 120
- policy_class: Machine
```

Multiple policy configuration

```
Company Local Group Policy:
lgpo.set:
- computer_policy:
  Deny logon locally: Guest
  Account lockout duration: 120
  Account lockout threshold: 10
  Reset account lockout counter after: 1440
  Enforce password history: 24
  Maximum password age: 60
  Minimum password age: 1
  Minimum password length: 14
  Password must meet complexity requirements: Enabled
  Store passwords using reversible encryption: Disabled
  Configure Automatic Updates:
    Configure automatic updating: 4 - Auto download and schedule the
↳intsall
    Scheduled install day: 7 - Every Saturday
    Scheduled install time: 17:00
  Specify intranet Microsoft update service location:
    Set the intranet update service for detecting updates: http://mywsus
    Set the intranet statistics server: http://mywsus
- user_policy:
  Do not process the legacy run list: Enabled
```

```

server_policy:
  lgpo.set:
    - computer_policy:
        Maximum password age: 60
        Minimum password age: 1
        Minimum password length: 14
        Account lockout duration: 1440
        Account lockout threshold: 10
        Reset account lockout counter after: 1440
        Manage auditing and security log:
          - "BUILTIN\Administrators"
        Replace a process level token:
          - "NT AUTHORITY\NETWORK SERVICE"
          - "NT AUTHORITY\LOCAL SERVICE"
        "Accounts: Guest account status": Disabled
        "Accounts: Rename guest account": Not_4_U
        "Audit: Audit the use of Backup and Restore privilege": Enabled
        "Interactive logon: Do not display last user name": Enabled
        "Network\DNS Client\Dynamic update": Disabled
        "System\Logon\Do not display the Getting Started welcome screen at logon":
↪ Enabled
        "Windows Components\Remote Desktop Services\Remote Desktop Session
↪ Host\Connections\Select RDP transport protocols":
        "Select Transport Type": "Use both UDP and TCP"
        "Windows Components\Windows Update\Allow Automatic Updates immediate
↪ installation": Enabled
        "Windows Components\Windows Update\Allow non-administrators to receive update
↪ notifications": Disabled
        "Windows Components\Windows Update\Always automatically restart at the
↪ scheduled time":
        "The restart timer will give users this much time to save their work
↪ (minutes)": 15
        "Windows Components\Windows Update\Automatic Updates detection frequency":
        "Check for updates at the following interval (hours)": 1
        "Windows Components\Windows Update\Configure Automatic Updates":
        "Configure automatic updating": 4 - Auto download and schedule the install
        "Install during automatic maintenance": False
        "Scheduled install day": 7 - Every Saturday
        "Scheduled install time": "17:00"
        "Windows Components\Windows Update\Delay Restart for scheduled installations":
        "Wait the following period before proceeding with a scheduled restart
↪ (minutes)": 1
        "Windows Components\Windows Update\No auto-restart with logged on users for
↪ scheduled automatic updates installations": Disabled
        "Windows Components\Windows Update\Re-prompt for restart with scheduled
↪ installations":
        "Wait the following period before prompting again with a scheduled
↪ restart (minutes)": 30
        "Windows Components\Windows Update\Reschedule Automatic Updates scheduled
↪ installations": Disabled
        "Windows Components\Windows Update\Specify intranet Microsoft update service
↪ location":
        "Set the intranet update service for detecting updates": http://mywsus
        "Set the intranet statistics server": http://mywsus
    - cumulative_rights_assignments: True

```

```
salt.states.win_lgpo.set_(name, setting=None, policy_class=None, computer_policy=None,
                          user_policy=None, cumulative_rights_assignments=True,
                          adml_language='en-US')
```

Ensure the specified policy is set

name the name of a single policy to configure

setting the configuration setting for the single named policy if this argument is used the computer_policy/user_policy arguments will be ignored

policy_class the policy class of the single named policy to configure this can "machine", "user", or "both"

computer_policy a dict of policyname: value pairs of a set of computer policies to configure if this argument is used, the name/setting/policy_class arguments will be ignored

user_policy a dict of policyname: value pairs of a set of user policies to configure if this argument is used, the name/setting/policy_class arguments will be ignored

cumulative_rights_assignments determine if any user right assignment policies specified will be cumulative or explicit

adml_language the adml language to use for AMDX policy data/display conversions

21.19.292 salt.states.win_license module

Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
license.activate
```

```
salt.states.win_license.activate(name)
```

Install and activate the given product key

name The 5x5 product key given to you by Microsoft

21.19.293 salt.states.win_network

Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the `network` state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
network.managed:
- dns_proto: dhcp
- ip_proto: dhcp
```

Note: Both the `dns_proto` and `ip_proto` arguments are required.

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
network.managed:
- dns_proto: static
```

(continues on next page)

(continued from previous page)

```

- dns_servers:
  - 8.8.8.8
  - 8.8.4.4
- ip_proto: static
- ip_addrs:
  - 10.2.3.4/24

```

Note: IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```

Local Area Connection #2:
network.managed:
  - dns_proto: static
  - dns_servers:
    - 8.8.8.8
    - 8.8.4.4
  - ip_proto: static
  - ip_addrs:
    - 10.2.3.4/24
  - gateway: 10.2.3.1

```

`salt.states.win_network.managed`(*name*, *dns_proto=None*, *dns_servers=None*, *ip_proto=None*, *ip_addrs=None*, *gateway=None*, *enabled=True*, ***kwargs*)

Ensure that the named interface is configured properly.

Parameters

- **name** (*str*) – The name of the interface to manage
- **dns_proto** (*str*) – None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. set to `dhcp` to use DHCP to get the DNS servers.
- **dns_servers** (*list*) – None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). None will make no changes.
- **ip_proto** (*str*) – None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **ip_addrs** (*list*) – None A list of static IP addresses with netmask flag, ie: `192.168.0.11/24`
- **gateway** (*str*) – None The gateway to set for the interface
- **enabled** (*bool*) – True Set to `False` to ensure that this interface is disabled.

Returns A dictionary of old and new settings

Return type `dict`

Example:

```

Ethernet1:
network.managed:
  - dns_proto: static
  - dns_servers:
    - 8.8.8.8
    - 8.8.8.4
  - ip_proto: static
  - ip_addrs:
    - 192.168.0.100/24

```

Clear DNS entries example:

```
Ethernet1:
network.managed:
- dns_proto: static
- dns_servers: []
- ip_proto: dhcp
```

21.19.294 salt.states.win_path

Manage the Windows System PATH

`salt.states.win_path.absent`(*name*)

Remove the directory from the SYSTEM path

index: where the directory should be placed in the PATH (default: 0)

Example:

```
'C:\sysinternals':
win_path.absent
```

`salt.states.win_path.exists`(*name*, *index=None*)

Add the directory to the system PATH at index location

index Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

Note: If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

```
'C:\python27':
win_path.exists

'C:\sysinternals':
win_path.exists:
- index: 0

'C:\mystuff':
win_path.exists:
- index: -1
```

21.19.295 salt.states.win_pki module

Microsoft certificate management via the Pki PowerShell module.

platform Windows

New in version 2016.11.0.

`salt.states.win_pki.import_cert`(*name*, *cert_format='cer'*, *context='LocalMachine'*, *store='My'*, *exportable=True*, *password=""*, *saltenv='base'*)

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) – The path of the certificate file to import.

- **cert_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **exportable** (*bool*) – Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) – The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
    - context: LocalMachine
    - store: My
    - exportable: True
    - password: TestPassword
    - saltenv: base
```

`salt.states.win_pki.remove_cert` (*name*, *thumbprint*, *context*='LocalMachine', *store*='My')

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
    - context: LocalMachine
    - store: My
```

21.19.296 salt.states.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set timeout to 30 minutes on battery power
monitor:
  powercfg.set_timeout:
```

(continues on next page)

(continued from previous page)

- **value:** 30
- **power:** dc

`salt.states.win_powercfg.set_timeout`(*name*, *value*, *power*='ac', *scheme*=None)

Set the sleep timeouts of specific items such as disk, monitor, etc.

Parameters

- **name** (*str*) – The setting to change, can be one of the following:
 - monitor
 - disk
 - standby
 - hibernate
- **value** (*int*) – The amount of time in minutes before the item will timeout
- **power** (*str*) – Set the value for AC or DC power. Default is ac. Valid options are:
 - ac (AC Power)
 - dc (Battery)
- **scheme** (*str*) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
 - SCHEME_BALANCED - Balanced
 - SCHEME_MAX - Power saver
 - SCHEME_MIN - High performance

CLI Example:

```
# Set monitor timeout to 30 minutes on Battery
monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

# Set disk timeout to 10 minutes on AC Power
disk:
  powercfg.set_timeout:
    - value: 10
    - power: ac
```

21.19.297 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>

platform Windows Server 2008R2 or greater

depends win_servermanager.install

depends win_servermanager.remove

`salt.states.win_servermanager.installed`(*name*, *features*=None, *recurse*=False, *restart*=False, *source*=None, *exclude*=None, ***kwargs*)

Install the windows feature. To install a single feature, use the `name` parameter. To install multiple features, use the `features` parameter.

Note: Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

Parameters

- **name** (*str*) - Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma delimited list (no spaces)

Note: A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

- **features** (*Optional[list]*) - A list of features to install. If this is passed it will be used instead of the name parameter.

New in version 2018.3.0.

- **recurse** (*Optional[bool]*) - Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features
- **source** (*Optional[str]*) - Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) - Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) - The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

Warning: As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in “exclude“ is not a sub-feature of one of the installed items it will still be removed.**

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
  win_servermanager.installed:
    - recurse: True
    - name: Web-Server

# Install multiple features, exclude the Web-Service
install_multiple_features:
  win_servermanager.installed:
    - recurse: True
    - features:
      - RemoteAccess
      - XPS-Viewer
      - SNMP-Service
```

(continues on next page)

(continued from previous page)

- ```
- exclude:
 - Web-Server
```

`salt.states.win_servermanager.removed(name, features=None, remove_payload=False, restart=False)`

Remove the windows feature To remove a single feature, use the `name` parameter. To remove multiple features, use the `features` parameter.

#### Parameters

- **name** (*str*) - Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma-delimited list (no spaces)

---

**Note:** A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

---

- **features** (*Optional[list]*) - A list of features to remove. If this is passed it will be used instead of the `name` parameter.

New in version 2018.3.0.

- **remove\_payload** (*Optional[bool]*) - True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the `source`
- **restart** (*Optional[bool]*) - Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

---

**Note:** Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

---

### Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
 win_servermanager.removed:
 - name: Web-Server

Uninstall multiple features, reboot if required
uninstall_multiple_features:
 win_servermanager.removed:
 - features:
 - RemoteAccess
 - XPX-Viewer
 - SNMP-Service
 - restart: True
```

## 21.19.298 salt.states.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.active_log_format(name, log_format, server='SmtpSvc/1')`

Manage the active log format for the SMTP server.

### Parameters

- **log\_format** (*str*) – The log format name.
- **server** (*str*) – The SMTP server name.

Example of usage:

```
smtp-log-format:
 win_smtp_server.active_log_format:
 - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.connection_ip_list(name, addresses=None, grant_by_default=False, server='SmtpSvc/1')`

Manage IP list for SMTP connections.

### Parameters

- **addresses** (*str*) – A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) – Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) – The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
 win_smtp_server.connection_ip_list:
 - addresses:
 127.0.0.1: 255.255.255.255
 172.16.1.98: 255.255.255.255
 172.16.1.99: 255.255.255.255
 - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses:
 172.16.1.100: 255.255.255.255
 172.16.1.101: 255.255.255.255
 - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses: {}
 - grant_by_default: True
```

`salt.states.win_smtp_server.relay_ip_list(name, addresses=None, server='SmtpSvc/1')`

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
'255.255.255.255', '127.0.0.1']
```

---

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

---

#### Parameters

- **addresses** (*str*) – A list of the relay IPs. The order of the list is important.
- **server** (*str*) – The SMTP server name.

Example of usage:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses:
 - 24.0.0.128
 - 32.0.0.128
 - 60.0.0.128
 - 1.0.0.0
 - 76.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 1.0.0.0
 - 1.0.0.0
 - 2.0.0.0
 - 2.0.0.0
 - 4.0.0.0
 - 0.0.0.0
 - 76.0.0.128
 - 0.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 255.255.255.255
 - 127.0.0.1
```

Example of usage for disabling relaying:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: None
```

Example of usage for allowing relaying from any source:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: []
```

`salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtpSvc/1')`  
Ensure the value is set for the specified setting.

---

**Note:** The setting names are case-sensitive.

---

**Parameters**

- **settings** (*str*) – A dictionary of the setting names and their values.
- **server** (*str*) – The SMTP server name.

Example of usage:

```
smtp-settings:
 win_smtp_server.server_setting:
 - settings:
 LogType: 1
 LogFilePeriod: 1
 MaxMessageSize: 16777216
 MaxRecipients: 10000
 MaxSessionSize: 16777216
```

### 21.19.299 salt.states.win\_snmp module

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.agent_settings` (*name, contact, location, services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**

- **contact** (*str*) – The SNMP contact.
- **location** (*str*) – The SNMP location.
- **services** (*str*) – A list of selected services.

Example of usage:

```
snmp-agent-settings:
 win_snmp.agent_settings:
 - contact: Test Contact
 - location: Test Location
 - services:
 - Physical
 - Internet
```

`salt.states.win_snmp.auth_traps_enabled` (*name, status=True*)

Manage the sending of authentication traps.

**Parameters** **status** (*bool*) – The enabled status.

Example of usage:

```
snmp-auth-traps:
 win_snmp.auth_traps_enabled:
 - status: True
```

`salt.states.win_snmp.community_names` (*name, communities=None*)

Manage the SNMP accepted community names and their permissions.

**Parameters** **communities** (*str*) – A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
 win_snmp.community_names:
 - communities:
```

(continues on next page)

(continued from previous page)

```

TestCommunity: Read Only
OtherCommunity: Read Write

```

### 21.19.300 salt.states.win\_system

#### Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

##### ERIK-WORKSTATION:

```
system.computer_name: []
```

This is Erik's computer, don't touch!:

```
system.computer_desc: []
```

`salt.states.win_system.computer_desc(name)`

Manage the computer's description field

**name** The desired computer description

`salt.states.win_system.computer_name(name)`

Manage the computer's name

**name** The desired computer name

`salt.states.win_system.hostname(name)`

New in version 2016.3.0.

Manage the hostname of the computer

**name** The hostname to set

`salt.states.win_system.join_domain(name, username=None, password=None, account_ou=None, account_exists=False, restart=False)`

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

##### Parameters

- **name** (*str*) – The name of the Domain.
- **username** (*str*) – Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply user.
- **password** (*str*) – Password of the account to add the computer to the Domain.
- **account\_ou** (*str*) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`.
- **account\_exists** (*bool*) – Needs to be set to `True` to allow re-using an existing computer account.
- **restart** (*bool*) – Needs to be set to `True` to restart the computer after a successful join.

Example:

##### join\_to\_domain:

##### system.join\_domain:

```

- name: mydomain.local.com
- username: myaccount@mydomain.local.com
- password: mysecretpassword
- restart: True

```

`salt.states.win_system.reboot`(*name*, *message=None*, *timeout=5*, *force\_close=True*, *in\_seconds=False*, *only\_on\_pending\_reboot=True*)

Reboot the computer

#### Parameters

- **message** (*str*) – An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is None.

- **timeout** (*int*) – The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is 5.

- **in\_seconds** (*bool*) – If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

The default value is False.

- **force\_close** (*bool*) – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

The default value is True.

- **only\_on\_pending\_reboot** (*bool*) – If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur.

The default value is True.

`salt.states.win_system.shutdown`(*name*, *message=None*, *timeout=5*, *force\_close=True*, *reboot=False*, *in\_seconds=False*, *only\_on\_pending\_reboot=False*)

Shutdown the computer

#### Parameters

- **message** (*str*) – An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is None.

- **timeout** (*int*) – The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is 5.

- **in\_seconds** (*bool*) – If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

The default value is False.

- **force\_close** (*bool*) – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

The default value is True.

- **reboot** (*bool*) – If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.

The default value is False.

- **only\_on\_pending\_reboot** (*bool*) – If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.

The default value is False.

### 21.19.301 salt.states.win\_wua module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
Install a single update using the KB
KB3194343:
 wua.installed

Install a single update using the name parameter
install_update:
 wua.installed:
 - name: KB3194343

Install multiple updates using the updates parameter and a combination of
KB number and GUID
install_updates:
 wua.installed:
 - updates:
 - KB3194343
 - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
Remove a single update using the KB
KB3194343:
 wua.removed

Remove a single update using the name parameter
remove_update:
 wua.removed:
 - name: KB3194343

Remove multiple updates using the updates parameter and a combination of
KB number and GUID
remove_updates:
 wua.removed:
 - updates:
 - KB3194343
 - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

**salt.states.win\_wua.installed**(*name*, *updates=None*)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

Parameters

- **name** (*str*) – The identifier of a single update to install.
- **updates** (*list*) – A list of identifiers for updates to be installed. Overrides name. Default is None.

---

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs

and KBs are the preferred method to ensure you're installing the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being installed.

**Returns** A dictionary containing the results of the update

**Return type** `dict`

CLI Example:

```
using a GUID
install_update:
 wua.installed:
 - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

using a KB
install_update:
 wua.installed:
 - name: KB3194343

using the full Title
install_update:
 wua.installed:
 - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
 ↪ (for x64-based Systems) (KB3194343)

Install multiple updates
install_updates:
 wua.installed:
 - updates:
 - KB3194343
 - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.removed`(*name*, *updates=None*)

Ensure Microsoft Updates are uninstalled.

**Parameters**

- **name** (*str*) - The identifier of a single update to uninstall.
- **updates** (*list*) - A list of identifiers for updates to be removed. Overrides `name`. Default is `None`.

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're uninstalling the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being removed.

**Returns** A dictionary containing the results of the removal

**Return type** `dict`

CLI Example:

```
using a GUID
uninstall_update:
 wua.removed:
 - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

(continues on next page)

```

using a KB
uninstall_update:
 wua.removed:
 - name: KB3194343

using the full Title
uninstall_update:
 wua.removed:
 - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
 ↪(for x64-based Systems) (KB3194343)

Install multiple updates
uninstall_updates:
 wua.removed:
 - updates:
 - KB3194343
 - 28cf1b09-2b1a-458c-9bd1-971d1b26b211

```

`salt.states.win_wua.uptodate`(*name*, *software=True*, *drivers=False*, *skip\_hidden=False*, *skip\_mandatory=False*, *skip\_reboot=True*, *categories=None*, *severities=None*)

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

#### Parameters

- **name** (*str*) – The name has no functional value and is only used as a tracking reference
- **software** (*bool*) – Include software updates in the results (default is True)
- **drivers** (*bool*) – Include driver updates in the results (default is False)
- **skip\_hidden** (*bool*) – Skip updates that have been hidden. Default is False.
- **skip\_mandatory** (*bool*) – Skip mandatory updates. Default is False.
- **skip\_reboot** (*bool*) – Skip updates that require a reboot. Default is True.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
  - Definition Updates
  - Drivers (make sure you set `drivers=True`)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical

– Important

**Returns** A dictionary containing the results of the update

**Return type** dict

CLI Example:

```
Update the system using the state defaults
update_system:
 wua.uptodate

Update the drivers
update_drivers:
 wua.uptodate:
 - software: False
 - drivers: True
 - skip_reboot: False

Apply all critical updates
update_critical:
 wua.uptodate:
 - severities:
 - Critical
```

### 21.19.302 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.genrepo` (*name*, *force=False*, *allow\_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If *force* is True no checks will be made and the repository will be generated if *allow\_empty* is True then the state will not return an error if there are 0 packages,

---

**Note:** This state only loads on minions that have the `roles: salt-master` grain set.

---

Example:

```
winrepo:
 winrepo.genrepo
```

### 21.19.303 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

**depends** M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CA's, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

/etc/salt/master.d/peer.conf

```
peer:
 .*:
 - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
 '*':
 - cert
 'ca':
 - ca
 'www':
 - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
 service.running:
 - enable: True
 - listen:
 - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
 file.managed:
 - source: salt://signing_policies.conf

/etc/pki:
 file.directory

/etc/pki/issued_certs:
 file.directory

/etc/pki/ca.crt:
 x509.certificate_managed:
 - signing_private_key: /etc/pki/ca.key
 - CN: ca.example.com
 - C: US
 - ST: Utah
 - L: Salt Lake City
 - basicConstraints: "critical CA:true"
 - keyUsage: "critical cRLSign, keyCertSign"
 - subjectKeyIdentifier: hash
 - authorityKeyIdentifier: keyid,issuer:always
 - days_valid: 3650
 - days_remaining: 0
 - backup: True
 - managed_private_key:
 name: /etc/pki/ca.key
 bits: 4096
 backup: True
 - require:
 - file: /etc/pki
```

(continues on next page)

(continued from previous page)

```

mine.send:
 module.run:
 - func: x509.get_pem_entries
 - kwargs:
 glob_path: /etc/pki/ca.crt
 - onchanges:
 - x509: /etc/pki/ca.crt

```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/signing\_policies.conf

```

x509_signing_policies:
 www:
 - minions: 'www'
 - signing_private_key: /etc/pki/ca.key
 - signing_cert: /etc/pki/ca.crt
 - C: US
 - ST: Utah
 - L: Salt Lake City
 - basicConstraints: "critical CA:false"
 - keyUsage: "critical keyEncipherment"
 - subjectKeyIdentifier: hash
 - authorityKeyIdentifier: keyid,issuer:always
 - days_valid: 90
 - copypath: /etc/pki/issued_certs/

```

This state will instruct all minions to trust certificates signed by our new CA. Using jinja to strip newlines from the text avoids dealing with newlines in the rendered yaml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```

/usr/local/share/ca-certificates:
 file.directory

/usr/local/share/ca-certificates/intca.crt:
 x509.pem_managed:
 - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
↪']|replace('\n', '') }}

```

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

```

/etc/pki/www.crt:
 x509_certificate_managed:
 - ca_server: ca
 - signing_policy: www
 - public_key: /etc/pki/www.key
 - CN: www.example.com
 - days_remaining: 30
 - backup: True
 - managed_private_key:
 name: /etc/pki/www.key
 bits: 4096
 backup: True

```

```
salt.states.x509.certificate_managed(name, days_remaining=90, managed_aged_private_key=None, append_certs=None, **kwargs)
```

Manage a Certificate

**name** Path to the certificate

**days\_remaining** [90] The minimum number of days remaining when the certificate should be recreated. A value of 0 disables automatic renewal.

**managed\_private\_key** Manages the private key corresponding to the certificate. All of the arguments supported by `x509.private_key_managed` are supported. If `name` is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.

**append\_certs**: A list of certificates to be appended to the managed file.

**kwargs**: Any arguments supported by `x509.create_certificate` or `file.managed` are supported.

Examples:

```
/etc/pki/ca.crt:
x509.certificate_managed:
- signing_private_key: /etc/pki/ca.key
- CN: ca.example.com
- C: US
- ST: Utah
- L: Salt Lake City
- basicConstraints: "critical CA:true"
- keyUsage: "critical cRLSign, keyCertSign"
- subjectKeyIdentifier: hash
- authorityKeyIdentifier: keyid,issuer:always
- days_valid: 3650
- days_remaining: 0
- backup: True
```

```
/etc/ssl/www.crt:
x509.certificate_managed:
- ca_server: pki
- signing_policy: www
- public_key: /etc/ssl/www.key
- CN: www.example.com
- days_valid: 90
- days_remaining: 30
- backup: True
```

```
salt.states.x509.crl_managed(name, signing_private_key, signing_private_key_passphrase=None, signing_cert=None, revoked=None, days_valid=100, digest="", days_remaining=30, include_expired=False, **kwargs)
```

Manage a Certificate Revocation List

**name** Path to the certificate

**signing\_private\_key** The private key that will be used to sign this crl. This is usually your CA's private key.

**signing\_private\_key\_passphrase** Passphrase to decrypt the private key.

**signing\_cert** The certificate of the authority that will be used to sign this crl. This is usually your CA's certificate.

**revoked** A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

**days\_valid** [100] The number of days the certificate should be valid for.

**digest** The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.

**days\_remaining** [30] The crl should be automatically recreated if there are less than `days_remaining` days until the crl expires. Set to 0 to disable automatic renewal.

**include\_expired** [False] If True, include expired certificates in the CRL.

**kwargs** Any arguments supported by *file.managed* are supported.

Example:

```
/etc/pki/ca.crl:
x509.crl_managed:
- signing_private_key: /etc/pki/myca.key
- signing_cert: /etc/pki/myca.crt
- revoked:
- compromised_Web_key:
- certificate: /etc/pki/certs/badweb.crt
- revocation_date: 2015-03-01 00:00:00
- reason: keyCompromise
- terminated_vpn_user:
- serial_number: D6:D2:DC:D8:4D:5C:C0:F4
- not_after: 2016-01-01 00:00:00
- revocation_date: 2015-02-25 00:00:00
- reason: cessationOfOperation
```

**salt.states.x509.csr\_managed**(*name*, **\*\*kwargs**)

Manage a Certificate Signing Request

**name:** Path to the CSR

**properties:** The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

**kwargs:** Any arguments supported by *file.managed* are supported.

Example:

```
/etc/pki/mycert.csr:
x509.csr_managed:
- private_key: /etc/pki/mycert.key
- CN: www.example.com
- C: US
- ST: Utah
- L: Salt Lake City
- keyUsage: 'critical dataEncipherment'
```

**salt.states.x509.pem\_managed**(*name*, *text*, *backup=False*, **\*\*kwargs**)

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name:** The path to the file to manage

**text:** The PEM formatted text to write.

**kwargs:** Any arguments supported by *file.managed* are supported.

**salt.states.x509.private\_key\_managed**(*name*, *bits=2048*, *passphrase=None*, *cipher='aes\_128\_cbc'*, *new=False*, *overwrite=False*, *verbose=True*, **\*\*kwargs**)

Manage a private key's existence.

**name:** Path to the private key

**bits:** Key length in bits. Default 2048.

**passphrase:** Passphrase for encrypting the private key.

**cipher:** Cipher for encrypting the private key.

**new:** Always create a new key. Defaults to False. Combining new with `prereq`, or when used as part of a *managed\_private\_key* can allow key rotation whenever a new certificate is generated.

**overwrite:** Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose:** Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs:** Any kwargs supported by *file.managed* are supported.

Example:

The Jinja templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
 x509.private_key_managed:
 - bits: 4096
 - new: True
 {% if salt['file.file_exists']('/etc/pki/www.key') -%}
 - prereq:
 - x509: /etc/pki/www.crt
 {%- endif %}
```

### 21.19.304 salt.states.xmpp

#### Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.send_msg(name, recipient, profile)`  
Send a message to an XMPP user

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

`salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)`  
Send a message to an list of recipients or rooms

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipients:
 - admins@xmpp.example.com/salt
 - rooms:
 - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

### 21.19.305 salt.states.zabbix\_action

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_action.absent`(*name*, *\*\*kwargs*)

Makes the Zabbix Action to be absent (either does not exist or delete it).

#### Parameters

- **name** – Zabbix Action name
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-action-absent:
 zabbix_action.absent:
 - name: Action name
```

`salt.states.zabbix_action.present`(*name*, *params*, *\*\*kwargs*)

Creates Zabbix Action object or if differs update it according defined parameters

#### Parameters

- **name** – Zabbix Action name
- **params** – Definition of the Zabbix Action
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query\_object" and "query\_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

```
zabbix-action-present:
 zabbix_action.present:
 - name: VMS
 - params:
 eventsource: 2
 status: 0
 filter:
 evaltype: 2
 conditions:
 - conditiontype: 24
 operator: 2
 value: 'virtual'
 - conditiontype: 24
 operator: 2
 value: 'kvm'
 operations:
 - operationtype: 2
 - operationtype: 4
 ogroup:
 - groupid:
 query_object: hostgroup
 query_name: Virtual machines
 - groupid:
 query_object: hostgroup
 query_name: Databases
```

### 21.19.306 salt.states.zabbix\_host module

Management of Zabbix hosts.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_host.absent`(*name*, *\*\*kwargs*)

Ensures that the host does not exist, eventually deletes host.

New in version 2016.3.0.

**Param** *name*: technical name of the host

**Parameters**

- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**TestHostWithInterfaces:**

`zabbix_host.absent`

`salt.states.zabbix_host.assign_templates`(*host*, *templates*, *\*\*kwargs*)

Ensures that templates are assigned to the host.

New in version 2017.7.0.

**Parameters**

- **host** – technical name of the host
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**add\_zabbix\_templates\_to\_host:**

**zabbix\_host.assign\_templates:**

- **host**: TestHost
- **templates**:
  - "Template OS Linux"
  - "Template App MySQL"

`salt.states.zabbix_host.present`(*host*, *groups*, *interfaces*, *\*\*kwargs*)

Ensures that the host exists, eventually creates new host. NOTE: please use argument `visible_name` instead of `name` to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

**Parameters**

- **host** – technical name of the host
- **groups** – groupids of host groups to add the host to
- **interfaces** – interfaces to be created for the host
- **proxy\_host** – Optional proxy name or proxyid to monitor host
- **inventory** – Optional list of inventory names and values
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** – Optional - string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```

create_test_host:
 zabbix_host.present:
 - host: TestHostWithInterfaces
 - proxy_host: 12345
 - groups:
 - 5
 - 6
 - 7
 - interfaces:
 - test1.example.com:
 - ip: '192.168.1.8'
 - type: 'Agent'
 - port: 92
 - testing2_create:
 - ip: '192.168.1.9'
 - dns: 'test2.example.com'
 - type: 'agent'
 - main: false
 - testovaci1_ipmi:
 - ip: '192.168.100.111'
 - type: 'ipmi'
 - inventory:
 - alias: some alias
 - asset_tag: jlm3937

```

### 21.19.307 salt.states.zabbix\_hostgroup module

Management of Zabbix host groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.states.zabbix\_hostgroup.absent**(name, \*\*kwargs)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

#### Parameters

- **name** – name of the host group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

delete_testing_host_group:
 zabbix_hostgroup.absent:
 - name: 'My hostgroup name'

```

**salt.states.zabbix\_hostgroup.present**(name, \*\*kwargs)

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

#### Parameters

- **name** – name of the host group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
create_testing_host_group:
 zabbix_hostgroup.present:
 - name: 'My hostgroup name'
```

## 21.19.308 salt.states.zabbix\_mediatype module

Management of Zabbix mediatypes.

**codeauthor** Raymond Kuiper <qix@the-wired.net>

`salt.states.zabbix_mediatype.absent` (*name*, *\*\*kwargs*)

Ensures that the mediatype does not exist, eventually deletes the mediatype.

#### Parameters

- **name** – name of the mediatype
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_mediatype:
 zabbix_mediatype.absent:
 - name: 'Email'
```

`salt.states.zabbix_mediatype.present` (*name*, *mediatype*, *\*\*kwargs*)

Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory)

#### Parameters

- **name** – name of the mediatype
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_mediatype:
 zabbix_mediatype.present:
 - name: 'Email'
 - mediatype: 0
 - smtp_server: smtp.example.com
 - smtp_hello: zabbix.example.com
 - smtp_email: zabbix@example.com
```

### 21.19.309 salt.states.zabbix\_template

New in version 2017.7.

Management of Zabbix Template object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_template.absent(name, **kwargs)`

Makes the Zabbix Template to be absent (either does not exist or delete it).

#### Parameters

- **name** – Zabbix Template name
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-template-absent:
 zabbix_template.absent:
 - name: Ceph OSD
```

`salt.states.zabbix_template.is_present(name, **kwargs)`

Check if Zabbix Template already exists.

#### Parameters

- **name** – Zabbix Template name
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
does_zabbix-template-exist:
 zabbix_template.is_present:
 - name: Template OS Linux
```

`salt.states.zabbix_template.present(name, params, static_host_list=True, **kwargs)`

Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

#### Parameters

- **name** – Zabbix Template name
- **params** – Additional parameters according to Zabbix API documentation
- **static\_host\_list** – If hosts assigned to the template are controlled only by this state or can be also assigned externally
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Note:** If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query\_object" and "query\_name" instead of the value.

In this example we want to create template named "Testing Template", assign it to hostgroup Templates, link it to two ceph nodes and create a macro.

**Note:** IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new ID !!!

**Note:**

NOT SUPPORTED FEATURES:

- linked templates
- trigger dependencies
- groups and group prototypes for host prototypes

SLS Example:

```

zabbix-template-present:
 zabbix_template.present:
 - name: Testing Template
 # Do not touch existing assigned hosts
 # True will detach all other hosts than defined here
 - static_host_list: False
 - params:
 description: Template for Ceph nodes
 groups:
 # groups must already exist
 # template must be at least in one hostgroup
 - groupid:
 query_object: hostgroup
 query_name: Templates
 macros:
 - macro: "{$CEPH_CLUSTER_NAME}"
 value: ceph
 hosts:
 # hosts must already exist
 - hostid:
 query_object: host
 query_name: ceph-osd-01
 - hostid:
 query_object: host
 query_name: ceph-osd-02
 # templates:
 # Linked templates - not supported by state module but can be linked
 ↪ manually (will not be touched)

 applications:
 - name: Ceph OSD
 items:
 - name: Ceph OSD avg fill item
 key_: ceph.osd_avg_fill
 type: 2
 value_type: 0
 delay: 60
 units: '%'

```

(continues on next page)

(continued from previous page)

```

 description: 'Average fill of OSD'
 applications:

### 21.19.310 salt.states.zabbix\_user module

Management of Zabbix users.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_user.absent`(*name*, *\*\*kwargs*)  
Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

#### Parameters

- **name** – user alias
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### George:

```
zabbix_user.absent
```

`salt.states.zabbix_user.admin_password_present`(*name*, *password=None*, *\*\*kwargs*)  
Initial change of Zabbix Admin password to password taken from one of the sources (only the most prioritized one):

1. 'password' parameter
2. '\_connection\_password' parameter
3. pillar 'zabbix.password' setting

- 1) Tries to log in as Admin with password found in state password parameter or `_connection_password` or pillar or default zabbix password in this precise order, if any of them is present.
- 2) If one of above passwords matches, it tries to change the password to the most prioritized one.
- 3) If not able to connect with any password then it fails.

#### Parameters

- **name** – Just a name of state
- **password** – Optional - desired password for Admin to be set
- **\_connection\_user** – Optional - Ignored in this state (always assumed 'Admin')
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
password taken from pillar or _connection_password
zabbix-admin-password:
 zabbix_user.admin_password_present

directly set password
zabbix-admin-password:
 zabbix_user.admin_password_present:
 - password: SECRET_PASS
```

`salt.states.zabbix_user.present`(*alias*, *passwd*, *usrgrps*, *medias=None*, *password\_reset=False*, *\*\*kwargs*)

Ensures that the user exists, eventually creates new user. NOTE: use argument `firstname` instead of `name` to not mess values with `name` from salt sls.

New in version 2016.3.0.

#### Parameters

- **alias** – user alias
- **passwd** – user's password
- **usrgrps** – user groups to add the user to

- **medias** – Optional - user's medias to create
- **password\_reset** – whether or not to reset password at update
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```

make_user:
 zabbix_user.present:
 - alias: George
 - passwd: donottellanyonE@456x
 - password_reset: True
 - usrgrps:
 - 13
 - 7
 - medias:
 - me@example.com:
 - mediatype: mail
 - period: '1-7,00:00-24:00'
 - severity: NIWAHD
 - make_jabber:
 - active: true
 - mediatype: jabber
 - period: '1-5,08:00-19:00'
 - sendto: jabbera@example.com
 - text_me_morning_disabled:
 - active: false
 - mediatype: sms
 - period: '1-5,09:30-10:00'
 - severity: D
 - sendto: '+42032132588568'

```

### 21.19.311 salt.states.zabbix\_usergroup module

Management of Zabbix user groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_usergroup.absent` (*name*, *\*\*kwargs*)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

#### Parameters

- **name** – name of the user group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

delete_thai_monks_usrgrp:
 zabbix_usergroup.absent:
 - name: 'Thai monks'

```

`salt.states.zabbix_usergroup.present` (*name*, *\*\*kwargs*)

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user\\_group](https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group)

New in version 2016.3.0.

#### Parameters

- **name** – name of the user group
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

make_new_thai_monks_usergroup:
 zabbix_usergroup.present:
 - name: 'Thai monks'
 - gui_access: 1
 - debug_mode: 0
 - users_status: 0

```

### 21.19.312 salt.states.zabbix\_valuemap

New in version 2017.7.

Management of Zabbix Valuemap object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_valuemap.absent` (*name*, *\*\*kwargs*)

Makes the Zabbix Value map to be absent (either does not exist or delete it).

#### Parameters

- **name** – Zabbix Value map name
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

zabbix-valuemap-absent:
 zabbix_valuemap.absent:
 - name: Value map name

```

`salt.states.zabbix_valuemap.present` (*name*, *params*, *\*\*kwargs*)

Creates Zabbix Value map object or if differs update it according defined parameters

#### Parameters

- **name** – Zabbix Value map name
- **params** – Definition of the Zabbix Value map
- **\_connection\_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

zabbix-valuemap-present:
 zabbix_valuemap.present:
 - name: Number mapping
 - params:
 mappings:
 - value: 1
 newvalue: one
 - value: 2
 newvalue: two

```

### 21.19.313 salt.states.zcbuildout

#### Management of zc.buildout

This module is inspired from minitage's buildout maker (<https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py>)

New in version 2016.3.0.

---

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

---

#### Available Functions

- built

```

installed1
 buildout.installed:
 - name: /path/to/buildout

installed2
 buildout.installed:
 - name: /path/to/buildout
 - parts:
 - a
 - b
 - python: /path/to/pythonpath/bin/python
 - unless: /bin/test_something_installed
 - onlyif: /bin/test_else_installed

```

`salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, test_release=False, distribute=None, new_st=None, offline=False, newest=False, python='/usr/bin/python3', debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs)`

Install buildout in a specific directory

It is a thin wrapper to `modules.buildout.buildout`

**name** directory to execute in  
**quiet**

do not output console & logs

**config** buildout config to use (default: `buildout.cfg`)

**parts** specific buildout parts to run

**user** user used to run buildout as

New in version 2014.1.4.

**env** environment variables to set when running

**buildout\_ver** force a specific buildout version (1 | 2)

**test\_release** buildout accept test release

**new\_st** Forcing use of `setuptools >= 0.7`

**distribute** use `distribute` over `setuptools` if possible

**offline** does buildout run offline

**python** python to use

**debug** run buildout with `-D` debug flag

**onlyif** Only execute cmd if statement on the host return 0

**unless** Do not execute cmd if statement on the host return 0

**newest** run buildout in newest mode

**verbose** run buildout in verbose mode (`-vvvvv`)

**use\_vt** Use the new salt VT to stream output [experimental]

**loglevel** loglevel for buildout commands

### 21.19.314 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the 'zenoss' Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

```
enable_monitoring:
 zenoss.monitored:
 - name: web01.example.com
 - device_class: /Servers/Linux
 - collector: localhost
 - prod_state: 1000
```

`salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)`

Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
 zenoss.monitored:
 - name: web01.example.com
 - device_class: /Servers/Linux
 - collector: localhost
 - prod_state: 1000
```

### 21.19.315 salt.states.zk\_concurrency

## Control concurrency of steps within state execution using zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than `max_concurrency` steps are executing with a single path.

```

acquire_lock:
 zk_concurrency.lock:
 - name: /trafficeserver
 - zk_hosts: 'zookeeper:2181'
 - max_concurrency: 4
 - prereq:
 - service: trafficserver

trafficserver:
 service.running:
 - watch:
 - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
 file.managed:
 - source: salt://records.config

release_lock:
 zk_concurrency.unlock:
 - name: /trafficserver
 - require:
 - service: trafficserver

```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```

salt.states.zk_concurrency.lock(name, zk_hosts=None, identifier=None, max_concurrency=1,
 timeout=None, ephemeral_lease=False, profile=None,
 scheme=None, username=None, password=None, de-
 fault_acl=None)

```

Block state execution until you are able to get the lock (or hit the timeout)

```

salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False, pro-
 file=None, scheme=None, username=None, pass-
 word=None, default_acl=None)

```

Ensure that there are `min_nodes` in the party at `name`, optionally blocking if not available.

```

salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1,
 ephemeral_lease=False, profile=None, scheme=None, user-
 name=None, password=None, default_acl=None)

```

Remove lease from semaphore.

### 21.19.316 salt.states.zfs

States for managing zfs datasets

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils.zfs, salt.modules.zfs

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
test/shares/yuki:
 zfs.filesystem_present:
 - create_parent: true
 - properties:
 quota: 16G

test/iscsi/haruhi:
 zfs.volume_present:
 - create_parent: true
 - volume_size: 16M
 - sparse: true
 - properties:
 readonly: on

test/shares/yuki@frozen:
 zfs.snapshot_present

moka_origin:
 zfs.hold_present:
 - snapshot: test/shares/yuki@frozen

test/shares/moka:
 zfs.filesystem_present:
 - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
 zfs.snapshot_absent
```

**salt.states.zfs.bookmark\_absent** (*name*, *force=False*, *recursive=False*)

ensure bookmark is absent on the system

**name** [string] name of snapshot

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.bookmark\_present** (*name*, *snapshot*)

ensure bookmark exists

**name** [string] name of bookmark

**snapshot** [string] name of snapshot

**salt.states.zfs.filesystem\_absent** (*name*, *force=False*, *recursive=False*)

ensure filesystem is absent on the system

**name** [string] name of filesystem

**force** [boolean] try harder to destroy the dataset (zfs destroy -f)

**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a volume with name exists, this state will succeed without destroying the volume specified by name. This module is dataset type sensitive.

`salt.states.zfs.filesystem_present`(*name*, *create\_parent=False*, *properties=None*,  
*cloned\_from=None*)

ensure filesystem exists and has properties set

**name** [string] name of filesystem

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (-o)

---

**Note:** `cloned_from` is only use if the filesystem does not exist yet, when `cloned_from` is set after the filesystem exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

---

`salt.states.zfs.hold_absent`(*name*, *snapshot*, *recursive=False*)

ensure hold is absent on the system

**name** [string] name of hold

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

`salt.states.zfs.hold_present`(*name*, *snapshot*, *recursive=False*)

ensure hold is present on the system

**name** [string] name of hold

**snapshot** [string] name of snapshot

**recursive** [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

`salt.states.zfs.promoted`(*name*)

ensure a dataset is not a clone

**name** [string] name of fileset or volume

**Warning:** only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset

`salt.states.zfs.scheduled_snapshot`(*name*, *prefix*, *recursive=True*, *schedule=None*)

maintain a set of snapshots based on a schedule

**name** [string] name of filesystem or volume

**prefix** [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-yyyyymmdd\_hhmm'

**recursive** [boolean] create snapshots for all children also

**schedule** [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

**Warning:** snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

`salt.states.zfs.snapshot_absent` (*name*, *force=False*, *recursive=False*)

ensure snapshot is absent on the system

**name** [string] name of snapshot

**force** [boolean] try harder to destroy the dataset (`zfs destroy -f`)

**recursive** [boolean] also destroy all the child datasets (`zfs destroy -r`)

`salt.states.zfs.snapshot_present` (*name*, *recursive=False*, *properties=None*)

ensure snapshot exists and has properties set

**name** [string] name of snapshot

**recursive** [boolean] recursively create snapshots of all descendent datasets

**properties** [dict] additional zfs properties (`-o`)

`salt.states.zfs.volume_absent` (*name*, *force=False*, *recursive=False*)

ensure volume is absent on the system

**name** [string] name of volume

**force** [boolean] try harder to destroy the dataset (`zfs destroy -f`)

**recursive** [boolean] also destroy all the child datasets (`zfs destroy -r`)

**Warning:** If a filesystem with `name` exists, this state will succeed without destroying the filesystem specified by `name`. This module is dataset type sensitive.

`salt.states.zfs.volume_present` (*name*, *volume\_size*, *sparse=False*, *create\_parent=False*, *properties=None*, *cloned\_from=None*)

ensure volume exists and has properties set

**name** [string] name of volume

**volume\_size** [string] size of volume

**sparse** [boolean] create sparse volume

**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

**cloned\_from** [string] name of snapshot to clone

**properties** [dict] additional zfs properties (`-o`)

---

**Note:** `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The `sparse` parameter is ignored when using `cloned_from`.

---

### 21.19.317 salt.states.zone

Management of Solaris Zones

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** salt.modules.zoneadm, salt.modules.zonecfg

**platform** solaris

New in version 2017.7.0.

Below are some examples of how to use this state. Lets start with creating a zone and installing it.

```

omipkg1_configuration:
 zone.present:
 - name: omipkg1
 - brand: ipkg
 - zonepath: /zones/omipkg1
 - properties:
 - autoboot: true
 - ip-type: exclusive
 - cpu-shares: 50
 - resources:
 - attr:
 - name: owner
 - value: Jorge Schrauwen
 - type: string
 - attr:
 - name: description
 - value: OmniOS ipkg zone for testing
 - type: string
 - capped-memory:
 - physical: 64M
omipkg1_installation:
 zone.installed:
 - name: omipkg1
 - require:
 - zone: omipkg1_configuration
omipkg1_running:
 zone.booted:
 - name: omipkg1
 - require:
 - zone: omipkg1_installation

```

A zone without network access is not very useful. We could update the zone.present state in the example above to add a network interface or we could use a separate state for this.

```

omipkg1_network:
 zone.resource_present:
 - name: omipkg1
 - resource_type: net
 - resource_selector_property: mac-addr
 - resource_selector_value: "02:08:20:a2:a3:10"
 - physical: znic1
 - require:
 - zone: omipkg1_configuration

```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

---

**Note:** The following state run the omipkg1\_configuration state will add it again! If the entire configuration is managed it would be better to add resource\_prune and optionally the resource\_selector\_property properties to the resource.

---

```
omipkg1_strip_owner:
 zone.resource_present:
 - name: omipkg1
 - resource_type: attr
 - resource_selector_property: name
 - resource_selector_value: owner
 - require:
 - zone: omipkg1_configuration
```

Let's bump the zone's CPU shares a bit.

---

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

---

```
omipkg1_more_cpu:
 zone.property_present:
 - name: omipkg1
 - property: cpu-shares
 - value: 100
```

Or we can remove the limit altogether!

---

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

---

```
omipkg1_no_cpu:
 zone.property_absent:
 - name: omipkg1
 - property: cpu-shares
```

```
salt.states.zone.absent(name, uninstall=False)
 Ensure a zone is absent
 name [string] name of the zone
 uninstall [boolean] when true, uninstall instead of detaching the zone first.
```

```
salt.states.zone.attached(name, force=False)
 Ensure zone is attached
 name [string] name of the zone
 force [boolean] force attach the zone
```

```
salt.states.zone.booted(name, single=False)
 Ensure zone is booted
 name [string] name of the zone
 single [boolean] boot in single usermode
```

```
salt.states.zone.detached(name)
 Ensure zone is detached
 name [string] name of the zone
```

```
salt.states.zone.export(name, path, replace=False)
 Export a zones configuration
 name [string] name of the zone
 path [string] path of file to export too.
 replace [boolean] replace the file if it exists
```

`salt.states.zone.halted`(*name*, *graceful=True*)  
 Ensure zone is halted  
**name** [string] name of the zone  
**graceful** [boolean] use shutdown instead of halt if true

`salt.states.zone.import_`(*name*, *path*, *mode='import'*, *nodataset=False*, *brand\_opts=None*)  
 Import a zones configuration  
**name** [string] name of the zone  
**path** [string] path of the configuration file to import  
**mode** [string] either import, install, or attach  
**nodataset** [boolean] do not create a ZFS file system  
**brand\_opts** [boolean] brand specific options to pass

---

**Note:** The mode argument can be set to `import`, `install`, or `attach`. `import`: will only import the configuration `install`: will import and then try to install the zone `attach`: will import and then try to attach of the zone

---

```
omipkg1:
 zone.import:
 - path: /foo/bar/baz
```

`salt.states.zone.installed`(*name*, *nodataset=False*, *brand\_opts=None*)  
 Ensure zone is installed  
**name** [string] name of the zone  
**nodataset** [boolean] do not create a ZFS file system  
**brand\_opts** [boolean] brand specific options to pass

`salt.states.zone.present`(*name*, *brand*, *zonepath*, *properties=None*, *resources=None*)  
 Ensure a zone with certain properties and resources  
**name** [string] name of the zone  
**brand** [string] brand of the zone  
**zonepath** [string] path of the zone  
**properties** [list of key-value pairs] dict of properties  
**resources** [list of key-value pairs] dict of resources

---

**Note:** If the zone does not exist it will not be installed. You can use the ``zone.installed`` state for this.

---

**Note:**

**Default resource selectors:**

- fs: dir
- net: mac-addr
- device: match
- rctl: name
- attr: name
- dataset: name
- admin: user

**Warning:** Properties and resource will not be removed when they are absent from the state!

For properties, simple set them to ``None``.

For resources, add the `resource_prune` property and set it to `True`. Also specify the `resource_selector_property` if the default is not the one you want.

`salt.states.zone.property_absent`(*name*, *property*)

Ensure property is absent

**name** [string] name of the zone

**property** [string] name of property

---

**Note:** This does a `zonecfg clear` call. So the property may be reset to a default value! Does has the side effect of always having to be called.

---

`salt.states.zone.property_present`(*name*, *property*, *value*)

Ensure property has a certain value

**name** [string] name of the zone

**property** [string] name of property

**value** [string] value of property

`salt.states.zone.resource_absent`(*name*, *resource\_type*, *resource\_selector\_property*, *resource\_selector\_value*)

Ensure resource is absent

**name** [string] name of the zone

**resource\_type** [string] type of resource

**resource\_selector\_property** [string] unique resource identifier

**resource\_selector\_value** [string] value for resource selection

**Warning:** Both `resource_selector_property` and `resource_selector_value` must be provided, some properties like `name` are already reserved by salt in there states.

---

**Note:** You can set both `resource_selector_property` and `resource_selector_value` to `None` for resources that do not require them.

---

`salt.states.zone.resource_present`(*name*, *resource\_type*, *resource\_selector\_property*, *resource\_selector\_value*, **\*\*kwargs**)

Ensure resource exists with provided properties

**name** [string] name of the zone

**resource\_type** [string] type of resource

**resource\_selector\_property** [string] unique resource identifier

**resource\_selector\_value** [string] value for resource selection

**kwargs** [string|int|...] resource properties

**Warning:** Both `resource_selector_property` and `resource_selector_value` must be provided, some properties like `name` are already reserved by salt in states.

---

**Note:** You can set both `resource_selector_property` and `resource_selector_value` to `None` for resources that do not require them.

---

`salt.states.zone.uninstalled`(*name*)

Ensure zone is uninstalled

**name** [string] name of the zone

### 21.19.318 salt.states.zookeeper

**depends** kazoo

**configuration** See *salt.modules.zookeeper* for setup instructions.

#### ACLS

For more information about acls, please checkout the kazoo documentation.

[http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make\\_digest\\_acl](http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl)

The following options can be included in the acl dictionary:

**param username** Username to use for the ACL.

**param password** A plain-text password to hash.

**param write** Write permission.

**type write** bool

**param create** Create permission.

**type create** bool

**param delete** Delete permission.

**type delete** bool

**param admin** Admin permission.

**type admin** bool

**param all** All permissions.

**type all** bool

**salt.states.zookeeper.absent**(*name*, *version=-1*, *recursive=False*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Make sure znode is absent

**name** path to znode

**version** Specify the version which should be deleted Default: -1 (always match)

**recursive** Boolean to indicate if children should be recursively deleted Default: False

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

```
delete znode:
zookeeper.absent:
- name: /test
- recursive: True
```

**salt.states.zookeeper.acls**(*name*, *acls*, *version=-1*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Update acls on a znode

**name** path to znode  
**acls** list of acl dictionaries to set on znode  
**version** Specify the version which should be deleted Default: -1 (always match)  
**profile** Configured Zookeeper profile to authenticate with (Default: None)  
**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme** Scheme to authenticate with (Default: 'digest')  
**username** Username to authenticate (Default: None)  
**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

```

update acls:
 zookeeper.acls:
 - name: /test/name
 - acls:
 - username: daniel
 password: test
 all: True
 - username: gtmanfred
 password: test
 all: True

```

**salt.states.zookeeper.present**(*name, value, acls=None, ephemeral=False, sequence=False, makepath=False, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Make sure znode is present in the correct state with the correct acls

**name** path to znode  
**value** value znode should be set to  
**acls** list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None  
**ephemeral** Boolean to indicate if ephemeral znode should be created Default: False  
**sequence** Boolean to indicate if znode path is suffixed with a unique index Default: False  
**makepath** Boolean to indicate if the parent paths should be created Default: False  
**version** For updating, specify the version which should be updated Default: -1 (always match)  
**profile** Configured Zookeeper profile to authenticate with (Default: None)  
**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme** Scheme to authenticate with (Default: 'digest')  
**username** Username to authenticate (Default: None)  
**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

```

add znode:
 zookeeper.present:
 - name: /test/name
 - value: gtmanfred
 - makepath: True

update znode:
 zookeeper.present:
 - name: /test/name
 - value: daniel
 - acls:
 - username: daniel
 password: test
 read: true
 - username: gtmanfred

```

(continues on next page)

(continued from previous page)

```

 password: test
 read: true
 write: true
 create: true
 delete: true
 admin: true
- makepath: True

```

### 21.19.319 salt.states.zpool

States for managing zpools

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils.zfs, salt.modules.zpool

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```

oldpool:
 zpool.absent:
 - export: true

newpool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: salty storage pool
 - layout:
 - mirror:
 - /dev/disk0
 - /dev/disk1
 - mirror:
 - /dev/disk2
 - /dev/disk3

partitionpool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: disk partition salty storage pool
 ashift: '12'
 feature@lz4_compress: enabled
 - filesystem_properties:
 compression: lz4
 atime: on
 relatime: on

```

(continues on next page)

(continued from previous page)

```

- layout:
 - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cddb0b0f41b

simplepool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: another salty storage pool
 - layout:
 - /dev/disk0
 - /dev/disk1

```

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the `zfs` state module.

`salt.states.zpool.absent` (*name*, *export=False*, *force=False*)

ensure storage pool is absent on the system

**name** [string] name of storage pool

**export** [boolean] export instead of destroy the zpool if present

**force** [boolean] force destroy or export

`salt.states.zpool.present` (*name*, *properties=None*, *filesystem\_properties=None*, *layout=None*, *config=None*)

ensure storage pool is present on the system

**name** [string] name of storage pool

**properties** [dict] optional set of properties to set for the storage pool

**filesystem\_properties** [dict] optional set of filesystem properties to set for the storage pool (creation only)

**layout: dict** disk layout to use if the pool does not exist (creation only)

**config** [dict] fine grain control over this state

**Note:**

The following configuration properties can be toggled in the `config` parameter.

- `import` (true) - try to import the pool before creating it if absent
- `import_dirs` (None) - specify additional locations to scan for devices on import (comma-separated)
- `device_dir` (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
- `force` (false) - try to force the import or creation

**Note:** It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

```

- mirror:
 - /tmp/vdisk3
 - /tmp/vdisk2
- mirror:
 - /tmp/vdisk0
 - /tmp/vdisk1

```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** The legacy format is also still supported but not recommended, because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
 /tmp/vdisk3
 /tmp/vdisk2
mirror-1:
 /tmp/vdisk0
 /tmp/vdisk1
```

**Warning:** Pay attention to the order of your dict!

```
- mirror:
 - /tmp/vdisk0
 - /tmp/vdisk1
 - /tmp/vdisk2
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

## 21.20 thorium modules

|               |                                                                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>calc</i>   | Used to manage the thorium register.                                                                                                                                                                                                                                                                         |
| <i>check</i>  | The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite. |
| <i>file</i>   | Writes matches to disk to verify activity, helpful when testing                                                                                                                                                                                                                                              |
| <i>key</i>    | The key Thorium State is used to apply changes to the accepted/rejected/pending keys                                                                                                                                                                                                                         |
| <i>local</i>  | Run remote execution commands via the local client                                                                                                                                                                                                                                                           |
| <i>reg</i>    | Used to manage the thorium register.                                                                                                                                                                                                                                                                         |
| <i>runner</i> | React by calling asynchronous runners                                                                                                                                                                                                                                                                        |
| <i>status</i> | This thorium state is used to track the status beacon events and keep track of the active status of minions                                                                                                                                                                                                  |
| <i>timer</i>  | Allow for flow based timers.                                                                                                                                                                                                                                                                                 |
| <i>wheel</i>  | React by calling asynchronous runners                                                                                                                                                                                                                                                                        |

### 21.20.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

**depends** statistics PyPi module

`salt.thorium.calc.add`(*name, num, minimum=0, maximum=0, ref=None*)

Adds together the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.add:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.calc`(*name, num, oper, minimum=0, maximum=0, ref=None*)

Perform a calculation on the num most recent values. Requires a list. Valid values for `oper` are:

- `add`: Add last num values together
- `mul`: Multiple last num values together
- `mean`: Calculate mean of last num values
- `median`: Calculate median of last num values
- `median_low`: Calculate low median of last num values
- `median_high`: Calculate high median of last num values
- `median_grouped`: Calculate grouped median of last num values
- `mode`: Calculate mode of last num values

USAGE:

```
foo:
 calc.calc:
 - name: myregistry
 - num: 5
 - oper: mean
```

`salt.thorium.calc.mean`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mean:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.median`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.median_grouped`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the grouped mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_grouped:
 - name: myregentry
 - num: 5
```

`salt.thorium.calc.median_high`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the high mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_high:
 - name: myregentry
 - num: 5
```

`salt.thorium.calc.median_low`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the low mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_low:
 - name: myregentry
 - num: 5
```

`salt.thorium.calc.mode`(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mode of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mode:
 - name: myregentry
 - num: 5
```

`salt.thorium.calc.mul`(*name, num, minimum=0, maximum=0, ref=None*)

Multiplies together the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mul:
 - name: myregentry
 - num: 5
```

## 21.20.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.contains`(*name, value, count\_lt=None, count\_lte=None, count\_eq=None, count\_gte=None, count\_gt=None, count\_ne=None*)

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
 check.contains:
 - value: itni

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.eq(name, value)`

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
 check.eq:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.event(name)`

Checks for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:
 check.event

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: salt/foo/*/bar
```

`salt.thorium.check.gt(name, value)`

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:
 check.gt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.gte`(*name*, *value*)

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:
 check.gte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_eq`(*name*, *value*)

Only succeed if the length of the given register location is equal to the given value.

USAGE:

```
foo:
 check.len_eq:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_gt`(*name*, *value*)

Only succeed if length of the given register location is greater than the given value.

USAGE:

```
foo:
 check.len_gt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_gte`(*name*, *value*)

Only succeed if the length of the given register location is greater or equal than the given value

USAGE:

```
foo:
 check.len_gte:
 - value: 42

run_remote_ex:
 local.cmd:
```

(continues on next page)

(continued from previous page)

```
- tgt: '*'
- func: test.ping
- require:
 - check: foo
```

`salt.thorium.check.len_lt`(*name, value*)

Only succeed if the length of the given register location is less than the given value.

USAGE:

```
foo:
 check.len_lt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_lte`(*name, value*)

Only succeed if the length of the given register location is less than or equal the given value

USAGE:

```
foo:
 check.len_lte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_ne`(*name, value*)

Only succeed if the length of the given register location is not equal to the given value.

USAGE:

```
foo:
 check.len_ne:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.lt`(*name, value*)

Only succeed if the value in the given register location is less than the given value

USAGE:

```

foo:
 check.lt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo

```

`salt.thorium.check.lte`(*name, value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```

foo:
 check.lte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo

```

`salt.thorium.check.ne`(*name, value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```

foo:
 check.ne:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo

```

### 21.20.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

Then the file will be saved to:

You may also provide an absolute path for the file to be saved to:

```

/tmp/foo.save:
 file.save

```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
 file.save:
 filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.save`(*name*, *filter=False*)

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn't exist.

USAGE:

```
foo:
 file.save

/tmp/foo:
 file.save
```

## 21.20.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.timeout`(*name*, *delete=0*, *reject=0*)

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
 status.reg

clean_keys:
 key.timeout:
 - require:
 - status: statreg
 - delete: 300
```

## 21.20.5 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.cmd`(*name*, *tgt*, *func*, *arg=()*, *tgt\_type='glob'*, *ret=""*, *kwarg=None*, *\*\*kwargs*)

Execute a remote execution command

USAGE:

```
run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
```

(continues on next page)

(continued from previous page)

```

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.sleep
 - arg:
 - 30

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.sleep
 - kwarg:
 length: 30

```

### 21.20.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.clear(name)`  
Clear the namespace from the register

USAGE:

```

clearns:
 reg.clear:
 - name: myregister

```

`salt.thorium.reg.delete(name)`  
Delete the namespace from the register

USAGE:

```

deletens:
 reg.delete:
 - name: myregister

```

`salt.thorium.reg.list_(name, add, match, stamp=False, prune=0)`  
Add the specified values to the named list

If `stamp` is `True`, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last `prune` values will be kept in the list.

USAGE:

```

foo:
 reg.list:
 - add: bar
 - match: my/custom/event
 - stamp: True

```

`salt.thorium.reg.mean(name, add, match)`  
Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
 reg.mean:
 - add: data_field
 - match: my/custom/event
```

`salt.thorium.reg.set_(name, add, match)`

Add a value to the named set

USAGE:

```
foo:
 reg.set:
 - add: bar
 - match: my/custom/event
```

### 21.20.7 salt.thorium.runner module

React by calling asynchronous runners

`salt.thorium.runner.cmd(name, func=None, arg=(), **kwargs)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
 runner.cmd:
 - func: cloud.create
 - arg:
 - my-ec2-config
 - myinstance

run_cloud:
 runner.cmd:
 - func: cloud.create
 - kwargs:
 provider: my-ec2-config
 instances: myinstance
```

### 21.20.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.reg(name)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

### 21.20.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.hold(name, seconds)`

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
 timer.hold:
 - seconds: 30
```

### 21.20.10 salt.thorium.wheel module

React by calling asynchronous runners

`salt.thorium.wheel.cmd(name, fun=None, arg=(), **kwargs)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
 wheel.cmd:
 - fun: key.delete
 - match: minion_id
```

## 21.21 master tops modules

|                              |                                                   |
|------------------------------|---------------------------------------------------|
| <code>cobbler</code>         | Cobbler Tops                                      |
| <code>ext_nodes</code>       | External Nodes Classifier                         |
| <code>mongo</code>           | Read tops data from a mongodb collection          |
| <code>reclass_adapter</code> | Read tops data from a reclass database            |
| <code>saltclass</code>       | Saltclass Configuration                           |
| <code>varstack_top</code>    | Use <a href="#">Varstack</a> to provide tops data |

### 21.21.1 salt.tops.cobbler

#### Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
 cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

#### Module Documentation

`salt.tops.cobbler.top(**kwargs)`

Look up top data in Cobbler for a minion.

### 21.21.2 salt.tops.ext\_nodes

## External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```
master_tops:
 ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to 'cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard 'cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
 - basepackages
 - database
```

The above essentially is the same as a `top.sls` containing the following:

```
base:
 '*':
 - basepackages
 - database

base:
 '*':
 - basepackages
 - database
```

```
salt.tops.ext_nodes.top(**kwargs)
 Run the command configured
```

### 21.21.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to `'`.

### Configuring the Mongo Tops Subsystem

```

master_tops:
 mongo:
 collection: tops
 id_field: _id
 re_replace: ""
 re_pattern: \.example\.com
 states_field: states
 environment_field: environment

```

### Module Documentation

`salt.tops.mongo.top(**kwargs)`

Connect to a mongo database and read per-node tops data.

#### Parameters

- **collection** (\*) – The mongodb collection to read data from. Defaults to `'tops'`.
- **id\_field** (\*) – The field in the collection that represents an individual minion id. Defaults to `'_id'`.
- **re\_pattern** (\*) – If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re\_replace** (\*) – Use as the replacement value in node ids matched with `re_pattern`. Defaults to `''`. Feel free to use backreferences here.
- **states\_field** (\*) – The name of the field providing a list of states.
- **environment\_field** (\*) – The name of the field providing the environment. Defaults to `environment`.

#### 21.21.4 salt.tops.reclass\_adapter

Read tops data from a reclass database

This `master_tops` plugin provides access to the `reclass` database, such that state information (top data) are retrieved from `reclass`.

You can find more information about `reclass` at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```

master_tops:
 reclass:
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt

```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
 reclass_source_path: ~/code/reclass

ext_pillar:
 - reclass: *reclass

master_tops:
 reclass: *reclass
```

If you want to run `reclass` from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
 Query reclass for the top data (states of the minions).
```

### 21.21.5 salt.tops.saltclass

#### Saltclass Configuration

```
master_tops:
 saltclass:
 path: /srv/saltclass
```

#### Description

This module clones the behaviour of `reclass` (<http://reclass.pantsfullofunix.net/>), without the need of an external app, and add several features to improve flexibility. `Saltclass` lets you define your nodes from simple `yaml` files (`.yaml`) through hierarchical class inheritance with the possibility to override pillars down the tree.

#### Features

- Define your nodes through hierarchical class inheritance
- Reuse your `reclass` datas with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your `yaml` definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`

- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables \${} with possibility to escape them if needed \$\$ (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: <http://git.mauras.ch/salt/saltclass/src/master/examples>

| Terms usable in yaml files | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| classes                    | A list of classes that will be processed in order                  |
| states                     | A list of states that will be returned by master_tops function     |
| pillars                    | A yaml dictionary that will be returned by the ext_pillar function |
| environment                | Node saltenv that will be used by master_tops                      |

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added environment parameter for saltenv definition.

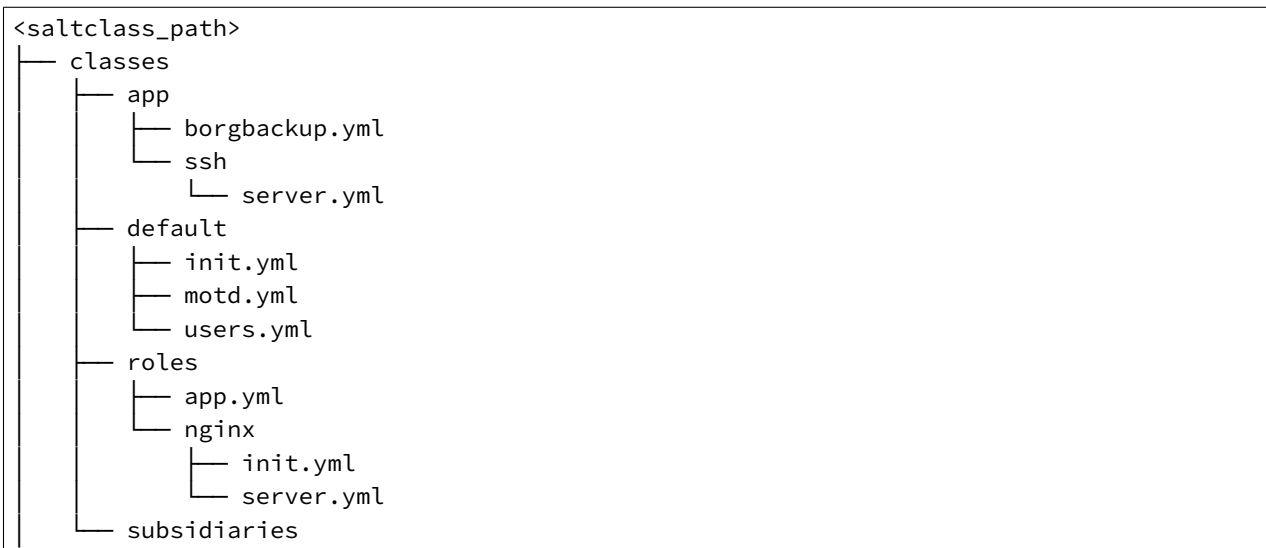

### Class names

Class names mimic salt way of defining states and pillar files. This means that default.users class name will correspond to one of these:

- <saltclass\_path>/classes/default/users.yml
- <saltclass\_path>/classes/default/users/init.yml

### Saltclass file hierachy

A saltclass tree would look like this:

(continues on next page)

(continued from previous page)

### Saltclass Examples

<saltclass\_path>/nodes/lausanne/qls.node1.yml

```

environment: base

classes:
{% for class in ['default'] %}
- {{ class }}
{% endfor %}
- subsidiaries.{{ __grains__['id'].split('.')[0] }}

```

<saltclass\_path>/classes/default/init.yml

```

classes:
- default.users
- default.motd

states:
- openssh

pillars:
default:
 network:
 dns:
 srv1: 192.168.0.1
 srv2: 192.168.0.2
 domain: example.com
 ntp:
 srv1: 192.168.10.10
 srv2: 192.168.10.20

```

<saltclass\_path>/classes/subsidiaries/gnv.yml

```

pillars:
default:
 network:
 sub: Geneva

```

(continues on next page)

(continued from previous page)

```

dns:
 srv1: 10.20.0.1
 srv2: 10.20.0.2
 srv3: 192.168.1.1
 domain: gnv.example.com
users:
 adm1:
 uid: 1210
 gid: 1210
 gecos: 'Super user admin1'
 homedir: /srv/app/adm1
 adm3:
 uid: 1203
 gid: 1203
 gecos: 'Super user adm

```

### Variable expansions

Escaped variables are rendered as is: `${test}`

Missing variables are rendered as is: `${net:dns:srv2}`

```

pillars:
 app:
 config:
 dns:
 srv1: ${default:network:dns:srv1}
 srv2: ${net:dns:srv2}
 uri: https://application.domain/call?\${test}
 prod_parameters:
 - p1
 - p2
 - p3
 pkg:
 - app-core
 - app-backend

```

### List override

Not using `^` as the first entry will simply merge the lists

```

pillars:
 app:
 pkg:
 - ^
 - app-frontend

```

---

### Note: Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `'${xx}'` will stay as is instead of being rendered as `'{xx}'`

---

```
salt.tops.saltclass.top(**kwargs)
 Compile tops
```

### 21.21.6 salt.tops.varstack\_top

Use *Varstack* to provide tops data

This *master\_tops* plugin provides access to the *varstack* hierarchical yaml files, so you can use *varstack* as a full *external node classifier* and store state information (top data) in it.

#### Configuring Varstack

To use *varstack* as a master top external node classifier, install *varstack* as documented. Then, add to your master's configuration:

```
master_tops:
 varstack: /path/to/the/config/file/varstack.yaml
```

*Varstack* will then use */path/to/the/config/file/varstack.yaml* (usually */etc/varstack.yaml*) to determine which configuration data to return as adapter information. From there you can take a look at the [README](#) of *varstack* to learn how this file is evaluated. The ENC part will just return the 'states' dictionary for the node.

Ie, if *my.fqdn.yaml* file contains:

```

states:
 - sudo
 - openssh
 - apache
 - salt.minion
```

these will be returned as `{'base': ['sudo', 'openssh', 'apache', 'salt.minion']}` and managed by salt as if given from a *top.sls* file.

```
salt.tops.varstack_top.top(**kwargs)
 Query varstack for the top data (states of the minions).
```

## 21.22 wheel modules

---

|                     |                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>config</i>       | Manage the master configuration file                                                                                         |
| <i>error</i>        | Error generator to enable integration testing of salt wheel error handling                                                   |
| <i>file_roots</i>   | Read in files from the <i>file_root</i> and save files to the file root                                                      |
| <i>key</i>          | Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.               |
| <i>minions</i>      | Wheel system wrapper for connected minions                                                                                   |
| <i>pillar_roots</i> | The <i>pillar_roots</i> wheel module is used to manage files under the <i>pillar roots</i> directories on the master server. |

---

### 21.22.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.apply(key, value)`  
Set a single key

---

**Note:** This will strip comments from your config file

---

`salt.wheel.config.update_config(file_name, yaml_contents)`  
Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
 'username': 'salt',
 'password': 'salt',
 'fun': 'config.update_config',
 'file_name': 'gui',
 'yaml_contents': {'id': 1},
 'client': 'wheel',
 'eauth': 'pam',
}
```

`salt.wheel.config.values()`  
Return the raw values of the config file

### 21.22.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.error(name=None, message="")`  
If name is None Then return empty dict  
Otherwise raise an exception with `__name__` from name, message from message  
CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

### 21.22.3 salt.wheel.file\_roots

Read in files from the `file_root` and save files to the file root

`salt.wheel.file_roots.find(path, saltenv='base')`  
Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.list_env(saltenv='base')`  
Return all of the file paths found in an environment

`salt.wheel.file_roots.list_roots()`  
Return all of the files names in all available environments

`salt.wheel.file_roots.read(path, saltenv='base')`  
Read the contents of a text file, if the file is binary then

`salt.wheel.file_roots.write(data, path, saltenv='base', index=0)`  
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

#### 21.22.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a `WheelClient` is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the `WheelClient` must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless `external_auth` is configured and the user is authorized to execute wheel functions.

The function documentation starts with the `wheel` reference from the code sample above and use the `WheelClient` functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a `salt` command at the CLI using the `saltutil execution module`.

`salt.wheel.key.accept(match, include_rejected=False, include_denied=False)`  
Accept keys based on a glob match. Returns a dictionary.  
**match** The glob match of keys to accept.  
**include\_rejected** To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.  
**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)`  
Accept keys based on a dict of keys. Returns a dictionary.  
**match** The dictionary of keys to accept.  
**include\_rejected** To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('key.accept_dict',
{
 'minions_pre': [
```

(continues on next page)

(continued from previous page)

```

 'jerry',
 'stuart',
 'bob',
],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

**salt.wheel.key.delete**(*match*)

Delete keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

**salt.wheel.key.delete\_dict**(*match*)

Delete keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
 'minions': [
 'jerry',
 'stuart',
 'bob',
],
})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

**salt.wheel.key.finger**(*match*, *hash\_type=None*)

Return the matching key fingerprints. Returns a dictionary.

**match** The key for with to retrieve the fingerprint.**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**salt.wheel.key.finger\_master**(*hash\_type=None*)

Return the fingerprint of the master's public key

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**salt.wheel.key.gen**(*id\_=None*, *keysize=2048*)

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the pub and priv keys with their generated values.

**id\_** Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg80rcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
```

(continues on next page)

(continued from previous page)

```
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}

```

`salt.wheel.key.gen_accept` (*id\_*, *keysize=2048*, *force=False*)

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

**id\_** The name of the minion for which to generate a key pair.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

**force** If a public key has already been accepted for the given minion on the master, then the `gen_accept` function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg80rcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}

```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.gen_keys` (*keydir=None*, *keyname=None*, *keysize=None*, *user=None*)

Generate minion RSA public keypair

`salt.wheel.key.gen_signature` (*priv*, *pub*, *signature\_path*, *auto\_create=False*, *keysize=None*)

Generate master public-key-signature

`salt.wheel.key.key_str` (*match*)

Return information about the key. Returns a dictionary.

**match** The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}

```

`salt.wheel.key.list_` (*match*)

List all the keys under a named status. Returns a dictionary.

**match** The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.list_all` ()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including

`minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.name_match`(*match*)

List all the keys based on a glob match

`salt.wheel.key.reject`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.reject_dict`(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
 'minions': [
 'jerry',
 'stuart',
 'bob',
],
}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

### 21.22.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.connected`()

List all connected minions on a salt-master

### 21.22.6 salt.wheel.pillar\_roots

The `pillar_roots` wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.find`(*path*, *saltenv='base'*)

Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.list_env(saltenv='base')`

Return all of the file paths found in an environment

`salt.wheel.pillar_roots.list_roots()`

Return all of the files names in all available environments

`salt.wheel.pillar_roots.read(path, saltenv='base')`

Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

## 22.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's *outputter system* to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the *state.event* runner to utilize Salt's event bus from shell scripts.

Salt's *netapi module* provides access to Salt externally via a REST interface. Review the *netapi module* documentation for more information.

### 22.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the *master* or *minion* config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like *LocalClient*.

```
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None,
 cache_minion_id=False, ignore_config_errors=True, minion_id=None,
 role='minion')
```

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the *Caller* class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

## 22.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the *mine*, *publish*, and *peer* execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the *Caller* class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False,
 loaded_base_name=None, notify=False, static_modules=None, proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

### Parameters

- **opts** (*dict*) – The Salt options dictionary
- **context** (*dict*) – A Salt context that should be made present inside generated modules in `__context__`
- **utils** (*dict*) – Utility functions which should be made available to Salt modules in `__utils__`. See *utils\_dirs* in `salt.config` for additional information about configuration.
- **whitelist** (*list*) – A list of modules which should be whitelisted.
- **initial\_load** (*bool*) – Deprecated flag! Unused.
- **loaded\_base\_name** (*str*) – A string marker for the loaded base name.
- **notify** (*bool*) – Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

```
salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.states`(*opts, functions, utils, serializers, whitelist=None, proxy=None*)

Returns the state modules

**Parameters**

- **opts** (*dict*) – The Salt options dictionary
- **functions** (*dict*) – A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.grains`(*opts, force\_refresh=False, proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have `__salt__` or `__proxy__` available. At proxy-minion startup, this function is called with the proxymodule `LazyLoader` object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.grain_funcs`(*opts, proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

### 22.1.3 Salt's Client Interfaces

#### LocalClient

**class** `salt.client.LocalClient`(*c\_path='/etc/salt/master', mopts=None, skip\_perm\_errors=False, io\_loop=None, keep\_loop=False, auto\_reconnect=False*)

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless *external\_auth* is configured and

authentication credentials are included in the execution).

**Note:** The LocalClient uses a Tornado IOloop, this can create issues when using the LocalClient inside an existing IOloop. If creating the LocalClient in partnership with another IOloop either create the IOloop before creating the LocalClient, or when creating the IOloop use `ioloop.current()` which will return the ioloop created by LocalClient.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

**cmd**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt\_type='glob'*, *ret=*, *jid=*, *full\_return=False*, *kwarg=None*, *\*\*kwargs*)

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
 'grains.items',
 'sys.doc',
 'cmd.run',
],
[
 [],
 [],
 ['uptime'],
])
```

#### Parameters

- **tgt** (*string or list*) – Which minions to target for the execution. Default is shell glob. Modified by the `tgt_type` option.
- **fun** (*string or list of strings*) – The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

**Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take

arguments must still have a corresponding empty list at the expected index.

- **arg** (*list or list-of-lists*) – A list of arguments to pass to the remote function. If the function takes no arguments **arg** may be omitted except when executing a compound command.
- **timeout** – Seconds to wait after the last minion returns but before all minions return.
- **tgt\_type** – The type of **tgt**. Allowed values:
  - **glob** - Bash glob completion - Default
  - **pcre** - Perl style regular expression
  - **list** - Python list of hosts
  - **grain** - Match based on a grain comparison
  - **grain\_pcre** - Grain comparison with a regex
  - **pillar** - Pillar data comparison
  - **pillar\_pcre** - Pillar data comparison with a regex
  - **nodegroup** - Match on nodegroup
  - **range** - Use a Range server for matching
  - **compound** - Pass a compound match string
  - **ipcidr** - Match based on Subnet (CIDR notation) or IPv4 address.

Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`

- **ret** – The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** – A dictionary with keyword arguments for the function.
- **full\_return** – Output the job return only (default) or the full return including exit code and other job metadata.
- **kwargs** – Optional keyword arguments. Authentication credentials may be passed when using [external\\_auth](#).

For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam')`. Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

**Returns** A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

**cmd\_async** (*tgt, fun, arg=(), tgt\_type='glob', ret=", jid=", kwarg=None, \*\*kwargs*)  
Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

**cmd\_batch** (*tgt, fun, arg=(), tgt\_type='glob', ret=", kwarg=None, batch='10%', \*\*kwargs*)  
Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

**Parameters batch** – The batch identifier of systems to execute on

**Returns** A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
... print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

**cmd\_iter**(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret=", kwarg=None, \*\*kwargs*)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

Normally `cmd_iter()` does not yield results for minions that are not connected. If you want it to return results for disconnected minions set `expect_minions=True` in `kwargs`.

**Returns** A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
... print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd\_iter\_no\_block**(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret=", kwarg=None, show\_jid=False, verbose=False, \*\*kwargs*)

Yields the individual minion returns as they come in, or `None` when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns, or `None` when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
... print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd\_subset**(*tgt, fun, arg=(), tgt\_type='glob', ret=", kwarg=None, sub=3, cli=False, progress=False, full\_return=False, \*\*kwargs*)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

**Parameters**

- **sub** – The number of systems to execute on
- **cli** – When this is set to `True`, a generator is returned, otherwise a dictionary of the minion returns is returned

```
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

**get\_cli\_returns**(*jid, minions, timeout=None, tgt='\*\*', tgt\_type='glob', verbose=False, show\_jid=False, \*\*kwargs*)

Starts a watcher looking at the return data for a specified JID

**Returns** all of the information for the JID

**get\_event\_iter\_returns**(*jid, minions, timeout=None*)

Gather the return data from the event system, break hard when timeout is reached.

**run\_job**(*tgt, fun, arg=(), tgt\_type='glob', ret=", timeout=None, jid=", kwarg=None, listen=False, \*\*kwargs*)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

**Returns** A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

## Salt Caller

**class** `salt.client.Caller` (*c\_path='/etc/salt/minion', mopts=None*)

Caller is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

**cmd** (*fun, \*args, \*\*kwargs*)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
 data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## Salt Proxy Caller

**class** `salt.client.ProxyCaller` (*c\_path='/etc/salt/proxy', mopts=None*)

`ProxyCaller` is the same interface used by the **salt-call** with the args `--proxyid <proxyid>` command-line tool on the Salt Proxy Minion.

Importing and using `ProxyCaller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

```
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

**Note:** To use this for calling proxies, the `is_proxy` functions requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

**cmd**(*fun*, \*args, \*\*kwargs)

Call an execution module with the given arguments and keyword arguments

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
 data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## RunnerClient

**class** salt.runner.RunnerClient(*opts*)

The interface used by the `salt-run` CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's `external_auth` can be used to authenticate calls. The `eauth` user must be authorized to execute runner modules: (`@runner`). Only the `master_call()` below supports `eauth`.

**asynchronous**(*fun*, *low*, *user*='UNKNOWN', *pub*=None)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd**(*fun*, *arg*=None, *pub\_data*=None, *kwarg*=None, *print\_event*=True, *full\_return*=False)

Execute a function

**cmd\_async**(*low*)

Execute a runner function asynchronously; `eauth` is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.eauth_async({
 'fun': 'jobs.list_jobs',
 'username': 'saltdev',
 'password': 'saltdev',
```

(continues on next page)

(continued from previous page)

```
 'eauth': 'pam',
 })
```

**cmd\_sync** (*low*, *timeout=None*, *full\_return=False*)

Execute a runner function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_sync({
 'fun': 'jobs.list_jobs',
 'username': 'saltdev',
 'password': 'saltdev',
 'eauth': 'pam',
 })
```

## WheelClient

**class** salt.wheel.WheelClient (*opts=None*)

An interface to Salt's wheel modules

*Wheel modules* interact with various parts of the Salt Master.

Importing and using WheelClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless *external\_auth* is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

**asynchronous** (*fun*, *low*, *user='UNKNOWN'*, *pub=None*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun*, *arg=None*, *pub\_data=None*, *kwarg=None*, *print\_event=True*, *full\_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**cmd\_async** (*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
 'fun': 'key.finger',
 'match': 'jerry',
 'eauth': 'auto',
 'username': 'saltdev',
 'password': 'saltdev',
 })
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

**cmd\_sync** (*low, timeout=None, full\_return=False*)

Execute a wheel function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@wheel).

```
>>> wheel.cmd_sync({
'fun': 'key.finger',
'match': 'jerry',
'eauth': 'auto',
'username': 'saltdev',
'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

## CloudClient

**class** salt.cloud.**CloudClient** (*path=None, opts=None, config\_dir=None, pillars=None*)

The client class to wrap cloud interactions

**action** (*fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
 kwargs={'image': 'ami-10314d79'})
)
```

**create** (*provider, names, \*\*kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(provider='my-ec2-config', names=['myinstance'],
 image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
 securitygroup='default', delvol_on_destroy=True)
```

**destroy** (*names*)

Destroy the named VMs

**extra\_action** (*names, provider, action, \*\*kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
 provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
)
client.extra_action(names=['salt-net'], action='network_create',
 provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})
)
```

**full\_query** (*query\_type='list\_nodes\_full'*)

Query all instance information

**list\_images** (*provider=None*)

List all available images in configured cloud systems

**list\_locations** (*provider=None*)  
List all available locations in configured cloud systems

**list\_sizes** (*provider=None*)  
List all available sizes in configured cloud systems

**low** (*fun, low*)  
Pass the cloud function and low data structure to run

**map\_run** (*path=None, \*\*kwargs*)  
To execute a map

**min\_query** (*query\_type='list\_nodes\_min'*)  
Query select instance information

**profile** (*profile, names, vm\_overrides=None, \*\*kwargs*)  
Pass in a profile to create, names is a list of vm names to allocate  
vm\_overrides is a special dict that will be per node options overrides  
Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
 'created_at': '2014-09-04T18:10:15Z',
 'droplet': {'event_id': 31000502,
 'id': 2530006,
 'image_id': 5140006,
 'name': 'minion01',
 'size_id': 66},
 'id': '2530006',
 'image_id': '5140006',
 'ip_address': '107.XXX.XXX.XXX',
 'locked': 'True',
 'name': 'minion01',
 'private_ip_address': None,
 'region_id': '4',
 'size_id': '66',
 'status': 'new'}}
```

**query** (*query\_type='list\_nodes'*)  
Query basic instance information

**select\_query** (*query\_type='list\_nodes\_select'*)  
Query select instance information

## SSHClient

**class** salt.client.ssh.client.**SSHClient** (*c\_path='/etc/salt/master', mopts=None, disable\_custom\_roster=False*)

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd** (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', kwarg=None, \*\*kwargs*)  
Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd\_iter** (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret=", kwarg=None, \*\*kwargs*)  
Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

## 22.2 netapi modules

### 22.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **salt-api** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

---

#### salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected `salt-api`. That project has been merged into the main Salt project.

---

See also:

*The full list of netapi modules*

### 22.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

**class** `salt.netapi.NetapiClient`(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

**local**(*\*args*, *\*\*kwargs*)

Run *execution modules* synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

**Returns** Returns the result from the execution module

**local\_async**(*\*args*, *\*\*kwargs*)

Run *execution modules* asynchronously

Wraps `salt.client.LocalClient.run_job()`.

**Returns** job ID

**local\_subset** (\*args, \*\*kwargs)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner** (fun, timeout=None, full\_return=False, \*\*kwargs)

Run *runner modules* <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the runner module

**runner\_async** (fun, \*\*kwargs)

Run *runner modules* <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** event data and a job ID for the executed function.

**ssh** (\*args, \*\*kwargs)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

**Returns** Returns the result from the salt-ssh command

**wheel** (fun, \*\*kwargs)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**wheel\_async** (fun, \*\*kwargs)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

## Writing netapi modules

`netapi` modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

*The full list of netapi modules*

## Configuration

All `netapi` configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherry.py:
port: 8000
debug: True
ssl_cert: /etc/pki/tls/certs/localhost.crt
ssl_key: /etc/pki/tls/certs/localhost.key
```

### The `__virtual__` function

Like all module types in Salt, `netapi` modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

### The `start` function

The `start()` function will be called for each `netapi` module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

### Multiple instances

New in version 2016.11.0.

`rest_cherry.py` and `rest_tornado` support running multiple instances by copying and renaming entire directory of those. To start the copied multiple `netapi` modules, add configuration blocks for the copied `netapi` modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied `netapi` module.

### Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your `netapi` module.

### Loader “magic” methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

## ARCHITECTURE

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 23.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 23.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of *file\_roots* and *pillar\_roots* need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with "hot" masters is here:

*Multimaster Tutorial*

#### 23.1.2 Multimaster with Failover

Changing the *master\_type* parameter from *str* to *failover* will cause minions to connect to the first responding master in the list of masters. Every *master\_alive\_interval* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *master\_alive\_interval* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial*

`master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

### 23.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in *Salt Syndic*.

### 23.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in *Salt Syndic*.

## 23.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

### 23.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
/etc/salt/master
syndic_master: 10.10.0.1 # may be either an IP address or a hostname
```

```
/etc/salt/minion
id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)

(continued from previous page)

```
on the Syndic node
id: my_syndic
```

On the Master node:

```
/etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

---

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

---

### 23.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

### 23.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
salt-syndic
or
service salt-syndic start
```

On the Master node:

```
salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

salt '*' test.version
minion_1:
 2018.3.4
minion_2:
 2018.3.4
minion_4:
 2018.3.4
minion_3:
 2018.3.4
```

### 23.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 23.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not know how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

**Note:** To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

---

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

---

**Note:** If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

---

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 23.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node `ret_port`
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

### 23.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

## MINION DATA CACHE

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 24.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

### 24.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

## SLOTS

New in version 2018.3.0.

---

**Note:** This functionality is under development and could be changed in the future releases

---

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the *highstate* or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

### 25.1 Execution functions

---

**Note:** Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

---

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

Also there are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don't need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
 file.copy:
 - name: __slot__:salt:test.echo(text=/tmp/some_file)
 - source: __slot__:salt:test.echo(/etc/hosts)
```

This will execute the *test.echo* execution functions right before calling the state. The functions in the example will return */tmp/some\_file* and */etc/hosts* strings that will be used as a target and source arguments in the state function *file.copy*.

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

## 26.1 Windows Software Repository

---

**Note:** In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

---

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

Requirements:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

### 26.1.1 Configuration

#### Populate the Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```

## Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

---

**Note:** Use `pkg.refresh_db` from 2016.11 when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

---

## 26.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

### Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

### Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.list_available firefox

winminion:
 - 15.0.1
 - 16.0.2
 - 17.0.1
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

## 26.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```

**Note:** `pkg.purge` just executes `pkg.remove` on Windows. At some point in the future `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

### 26.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: <https://github.com/saltstack/salt-winrepo-ng>
- Earlier releases: <https://github.com/saltstack/salt-winrepo>

By default, these repositories are mirrored to `/srv/salt/win/repo-ng` and `/srv/salt/win/repo`.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

### 26.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: [salt-winrepo](#) [salt-winrepo-ng](#)

**Note:** The newer software definition files are run through the salt's parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

**Important:** `winrepo_remotes` was called `win_gitrepos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online git repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (`salt-winrepo`) and new minions (`salt-winrepo-ng`). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

**Important:** If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the

contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the meta database file.

---

The next step (if you have older minions) is to create the meta database file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

---

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

---

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

---

On older minions (older than 2015.8.0) this will copy the `winrepo.p` file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (`.sls`) down to the minion and then create the meta database file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

---

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

---

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the meta database file to be created successfully.

---

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotest` set the following in the master config file:

```
winrepo_remotest: []
```

---

### 26.1.6 Creating a Package Definition SLS File

The package definition file is a yml file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```

firefox:
 '17.0.1':
 installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
 full_name: Mozilla Firefox 17.0.1 (x86 en-US)
 locale: en_US
 reboot: False
 install_flags: '-ms'
 uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
 uninstall_flags: '/S'
 '16.0.2':
 installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
 full_name: Mozilla Firefox 16.0.2 (x86 en-US)
 locale: en_US
 reboot: False
 install_flags: '-ms'
 uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
 uninstall_flags: '/S'
 '15.0.1':
 installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
 full_name: Mozilla Firefox 15.0.1 (x86 en-US)
 locale: en_US
 reboot: False
 install_flags: '-ms'
 uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
 uninstall_flags: '/S'

```

Each software definition file begins with a package name for the software. As in the example above `firefox`. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome.

(<https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi>)

When a new version is released, the url just points to the new version. To handle situations such as these, set the version to *latest*. Salt will install the version of Chrome at the URL and report that version. Here's an example:

```

chrome:
 latest:
 full_name: 'Google Chrome'
 installer: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'

```

(continues on next page)

(continued from previous page)

```

install_flags: '/qn /norestart'
uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
uninstall_flags: '/qn /norestart'
msiexec: True
locale: en_US
reboot: False

```

Available parameters are as follows:

**param str full\_name** The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```

salt 'test-2008' pkg.list_pkgs
test-2008

7-Zip 9.20 (x64 edition):
 9.20.00.0
Microsoft .NET Framework 4 Client Profile:
 4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
 4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
 9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
 17.0.1
Mozilla Maintenance Service:
 17.0.1
NSClient++ (x64):
 0.3.8.76
Notepad++:
 6.4.2
Salt Minion 0.16.0:
 0.16.0

```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository, the `full_name` will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```

test-2008:

7zip:
 9.20.00.0
Microsoft .NET Framework 4 Client Profile:
 4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
 4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
 9.0.21022
Mozilla Maintenance Service:
 17.0.1
Notepad++:
 6.4.2

```

(continues on next page)

(continued from previous page)

```

Salt Minion 0.16.0:
 0.16.0
firefox:
 17.0.1
nsclient:
 0.3.9.328

```

---

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the status can be verified when running a highstate.

---

**Note:** It is still possible to successfully install packages using `pkg.install`, even if the `full_name` or the version number don't match. However, this can make troubleshooting issues difficult, so be careful.

---

**Tip:** To force salt to display the full name when there's already an existing package definition file on the system, you can pass a bogus `saltenv` parameter to the command like so: `pkg.list_pkgs saltenv=NotARealEnv`

---

**param str installer** The path to the `.exe` or `.msi` to use to install the package. This can be a path or a URL. If it is a URL or a salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

---

**Note:** If storing software in the same location as the winrepo it is best practice to place each installer in its own directory rather than the root of winrepo. Then you can place your package definition file in the same directory. It is best practice to name the file `init.sls`. This will be picked up by `pkg.refresh_db` and processed properly.

---

**param str install\_flags** Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

**Warning:** Salt will not return if the installer is waiting for user input so it is imperative that the software package being installed has the ability to install silently.

**param str uninstaller** The path to the program used to uninstall this software. This can be the path to the same `exe` or `msi` used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- `Software\Microsoft\Windows\CurrentVersion\Uninstall`
- `Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall`

**param str uninstall\_flags** Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's [wiki](#):

**Warning:** Salt will not return if the uninstaller is waiting for user input so it is imperative that the software package being uninstalled has the ability to uninstall silently.

Here are some examples of installer and uninstaller settings:

```
7zip:
 '9.20.00.0':
 installer: salt://win/repo/7zip/7z920-x64.msi
 full_name: 7-Zip 9.20 (x64 edition)
 reboot: False
 install_flags: '/qn /norestart'
 msiexec: True
 uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
 uninstall_flags: '/qn /norestart'
```

Alternatively the uninstaller can also simply repeat the URL of an msi file:

```
7zip:
 '9.20.00.0':
 installer: salt://win/repo/7zip/7z920-x64.msi
 full_name: 7-Zip 9.20 (x64 edition)
 reboot: False
 install_flags: '/qn /norestart'
 msiexec: True
 uninstaller: salt://win/repo/7zip/7z920-x64.msi
 uninstall_flags: '/qn /norestart'
```

**param msiexec** This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations. Possible options are: `True`, `False` or the path to `msiexec.exe` on your system

```
7zip:
 '9.20.00.0':
 installer: salt://win/repo/7zip/7z920-x64.msi
 full_name: 7-Zip 9.20 (x64 edition)
 reboot: False
 install_flags: '/qn /norestart'
 msiexec: 'C:\Windows\System32\msiexec.exe'
 uninstaller: salt://win/repo/7zip/7z920-x64.msi
 uninstall_flags: '/qn /norestart'
```

**param bool allusers** This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is `True`.

**param bool cache\_dir** If `True` and the installer URL begins with `salt://`, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

**Warning:** Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your installer file in the root of winrepo (`/srv/salt/win/repo-ng`) and `cache_dir: True` the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

**param str cache\_file** When the installer URL begins with `salt://`, this indicates a single file to copy

down for use with the installer. It is copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don't want to cache additional files that may reside in the installer directory.

Here's an example for a software package that has dependent files:

```
sqlexpress:
 '12.0.2000.8':
 installer: 'salt://win/repo/sqlexpress/setup.exe'
 full_name: Microsoft SQL Server 2014 Setup (English)
 reboot: False
 install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
 cache_dir: True
```

**param bool use\_scheduler** If `True`, Windows will use the task scheduler to run the installation. This is useful for running the Salt installation itself as the installation process kills any currently running instances of Salt.

**param str source\_hash** This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example of `source_hash` usage:

```
messageanalyzer:
 '4.0.7551.0':
 full_name: 'Microsoft Message Analyzer'
 installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
 install_flags: '/quiet /norestart'
 uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
 uninstall_flags: '/quiet /norestart'
 msiexec: True
 source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

**param bool reboot** Not implemented

**param str local** Not implemented

Examples can be found at <https://github.com/saltstack/salt-winrepo-ng>

## 26.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the `winrepo` runner that is used on the Salt master, an `execution` module exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

## Custom Location for Repository SLS Files

If *file\_roots* has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The `winrepo.genrepo` function from the `winrepo` execution module will by default look for the filename specified by *winrepo\_cache\_file* within `C:\salt\srv\salt\win\repo`.

If the *file\_roots* parameter has been modified, then *winrepo\_dir* must be modified to fall within that path, at the proper relative path. For example, if the base environment in *file\_roots* points to `D:\foo`, and *winrepo\_source\_dir* is `salt://win/repo`, then *winrepo\_dir* must be set to `D:\foo\win\repo` to ensure that `winrepo.genrepo` puts the cache file into right location.

### 26.1.8 Configuration options for Minions 2015.8.0 and later

The *winrepo\_source\_dir* config parameter (default: `salt://win/repo-ng/`) controls where *pkg.refresh\_db* fetches the software package definitions. *pkg.refresh\_db* generates meta database file called *winrepo\_cache\_file* on the minion.

### 26.1.9 Cache configuration options for Minions 2016.11.0 and later

Software package definitions are automatically refresh if stale after *winrepo\_cache\_expire\_max*. Running a highstate normal forces the refresh of the package definition and generation of meta database, unless the meta database is younger than *winrepo\_cache\_expire\_max*. Refreshing the package definition can take some time, these options were introduced to allow more control of when it occurs.

It's important use *pkg.refresh\_db* to check for errors and ensure the latest package definition is on any minion your testing new definitions on.

### 26.1.10 Configuration options for Minions before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cache file (the file generated by the *winrepo.genrepo\_runner*) at `salt://win/repo/winrepo.p`. If the cache file is in a different path on the salt fileserver, then *win\_repo\_cache\_file* will need to be updated to reflect the proper location.

### 26.1.11 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

On the master, the *winrepo.update\_git\_repos* runner has been updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running *winrepo.update\_git\_repos*.

If neither `GitPython` nor `pygit2` are installed, then Salt will fall back to the pre-existing behavior for *winrepo.update\_git\_repos*, and a warning will be logged in the master log.

---

**Note:** Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the *git.latest* state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

---

## Config Parameters Renamed

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

### Master Config

| Old Name                 | New Name                 |
|--------------------------|--------------------------|
| win_repo                 | <i>winrepo_dir</i>       |
| win_repo_mastercachefile | <i>winrepo_cachefile</i> |
| win_gitrepos             | <i>winrepo_remotes</i>   |

---

**Note:** *winrepo\_cachefile* is no longer used by 2015.8.0 and later minions, and the *winrepo\_dir* setting is replaced by *winrepo\_dir\_ng* for 2015.8.0 and later minions.

---

See [here](#) for detailed information on all master config options for the Windows Repo.

### Minion Config

| Old Name           | New Name                 |
|--------------------|--------------------------|
| win_repo           | <i>winrepo_dir</i>       |
| win_repo_cachefile | <i>winrepo_cachefile</i> |
| win_gitrepos       | <i>winrepo_remotes</i>   |

See [here](#) for detailed information on all minion config options for the Windows Repo.

## pygit2/GitPython Support for Maintaining Git Repos

The *winrepo.update\_git\_repos* runner (and the corresponding `remote` execution function for standalone minions) now makes use of the same underlying code used by the *Git Fileserver Backend* and *Git External Pillar* to maintain and update its local clones of git repositories. If a compatible version of either *pygit2* (0.20.3 and later) or *GitPython* (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the *git.latest* state).

---

**Note:** If compatible versions of both *pygit2* and *GitPython* are installed, then Salt will prefer *pygit2*, to override this behavior use the *winrepo\_provider* configuration parameter:

```
winrepo_provider: gitpython
```

The *winrepo* execution module (discussed above in the *Managing Windows Software on a Standalone Windows Minion* section) does not yet officially support the new *pygit2/GitPython* functionality, but if either *pygit2* or *GitPython* is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

---

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run `winrepo.update_git_repos` to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (NOTE: `pygit2` only), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
- https://github.com/saltstack/salt-winrepo.git
- git@github.com:myuser/myrepo.git:
 - pubkey: /path/to/key.pub
 - privkey: /path/to/key
 - passphrase: myaw3s0m3pa$$phr4$3
- https://github.com/myuser/privaterepo.git:
 - user: mygithubuser
 - password: CorrectHorseBatteryStaple
```

---

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

---

There are a couple other changes in how Salt manages git repos using `pygit2/GitPython`. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git
- https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git:
 - name: baz_junior
- https://github.com/foobar/baz:
 - name: baz_the_third
```

## 26.1.12 Troubleshooting

### Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

### Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

### Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi Windows installer provider" to have full list of installed packages. If you don't have this, salt-minion can't report some installed software.

### How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

## 26.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

### 26.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

### 26.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. `specify user=Administrator` instead of `user=administrator`.

Follow [issue #11801](#) for any changes to this behavior.

### 26.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. `username`, `mydomain\username`, `username@mydomain.tld` can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow [issue #11801](#) for any changes to this behavior.

### 26.2.4 Specifying the None group

Each Windows system has built-in `_None_` group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word `_None_` has special meaning in Python - it is a special value indicating 'nothing', similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chgrp C:\path\to\file "'None'"`.

### 26.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

## DEVELOPING SALT

### 27.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

### 27.2 Salt Client

#### 27.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master\_event\_pub.ipc).

### 27.3 Salt Master

#### 27.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.

#### 27.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called 'salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 27.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish\_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 27.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master\_event\_pull.ipc
- IPC: master\_event\_pub.ipc

### 27.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker\_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 27.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

**The ReqServer is bound to the following:**

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 27.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

- 1) A command is issued on the CLI. For example, 'salt my\_minion test.version'.
- 2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master\_event\_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master\_event\_pub.ipc.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on publish\_pull.ipc.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish\_pull, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master\_event\_pull.ipc). (Again for the curious, this happens in AESFuncs.\_return()).
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master\_event\_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

## 27.4 Salt Minion

### 27.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect *back* to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.
- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

## 27.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_<unique_id>_pub.ipc` and `minion_event_<unique_id>_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

## 27.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the 'salt-call' script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a 'salt' command is as follows:

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
- 5) The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

## 27.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
- 2) AESFuncs is used everywhere else.

## 27.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review [Writing Salt Documentation](#).

## 27.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the [Salt Coding Style](#) documentation for information about Salt’s particular coding patterns.

Within the [Salt Coding Style](#) documentation, there is a section about running Salt’s `.testing.pylintrc` file. SaltStack recommends running the `.testing.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt’s repository. Please see the [Linting](#) documentation for more information.

---

**Note:** There are two pylint files in the `salt` directory. One is the `.pylintrc` file and the other is the `.testing.pylintrc` file. The tests that run in Jenkins against GitHub Pull Requests use `.testing.pylintrc`. The `.testing.pylintrc` file is a little less strict than the `.pylintrc` and is used to make it easier for contributors to submit changes. The `.pylintrc` file can be used for linting, but the `.testing.pylintrc` is the source of truth when submitting pull requests.

---

## 27.6.2 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors [GitHub’s own guide](#) and is well worth reading.

1. Fork [saltstack/salt](#) on GitHub.
2. Make a local clone of your fork.

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add [saltstack/salt](#) as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

4. Create a new branch in your clone.

---

**Note:** A branch should have one purpose. For example, “Fix bug X,” or “Add feature Y”. Multiple unrelated fixes and/or features should be isolated into separate branches.

---

If you’re working on a bug or documentation fix, create your branch from the oldest **supported** main release branch that contains the bug or requires the documentation update. See [Which Salt Branch?](#)

```
git fetch upstream
git checkout -b fix-broken-thing upstream/2016.11
```

If you’re working on a feature, create your branch from the `develop` branch.

```
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary.

---

**Note:** If your change fixes a bug or implements a feature already filed in the [issue tracker](#), be sure to [reference the issue number](#) in the commit message body.

---

```
Fix broken things in file1 and file2

Fixes #31337

Please enter the commit message for your changes. Lines starting
with '#' will be ignored, and an empty message aborts the commit.
On branch fix-broken-thing
Changes to be committed:
modified: path/to/file1
modified: path/to/file2
```

If you get stuck, there are many introductory Git resources on <http://help.github.com>.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

---

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/2016.11 fix-broken-thing
git push -u origin fix-broken-thing
```

or

```
git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
(use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force-with-lease` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-forward issue, will likely add extra commits to the pull request which were not part of your changes.

---

7. Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

8. Open a new pull request.

Click on `Pull Request` on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

1. If your branch is a fix for a release branch, choose that as the base branch (e.g. `2016.11`),

<https://github.com/my-account/salt/compare/saltstack:2016.11...fix-broken-thing>

If your branch is a feature, choose `develop` as the base branch,

<https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature>

2. Review that the proposed changes are what you expect.
3. Write a descriptive comment. Include links to related issues (e.g. 'Fixes #31337:') in the comment field.
4. Click `Create pull request`.

9. Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

1. Make the new changes in your local clone on the same local branch.
2. Push the branch to GitHub again using the same commands as before.
3. New and updated commits will be added to the pull request automatically.
4. Feel free to add a comment to the discussion.

---

**Note:** Jenkins

Pull request against `saltstack/salt` are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <http://jenkins.saltstack.com/>.

---

### 27.6.3 Salt's Branch Topology

There are three different kinds of branches in use: `develop`, main release branches, and dot release branches.

- All feature work should go into the `develop` branch.
- Bug fixes and documentation changes should go into the oldest **supported main** release branch affected by the the bug or documentation change (you can use the blame button in github to figure out when the bug was introduced). Supported releases are the last 2 releases. For example, if the latest release is 2018.3, the last two release are 2018.3 and 2017.7. Main release branches are named after a year and month, such as `2016.11` and `2017.7`.
- Hot fixes, as determined by SaltStack's release team, should be submitted against **dot** release branches. Dot release branches are named after a year, month, and version. Examples include `2016.11.8` and `2017.7.2`.

---

**Note:** GitHub will open pull requests against Salt's main branch, `develop`, by default. Be sure to check which branch is selected when creating the pull request.

---

### The Develop Branch

The `develop` branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the `develop` branch.

---

**Note:** If you have a bug fix or documentation change and have already forked your working branch from `develop` and do not know how to rebase your commits against another branch, then submit it to `develop` anyway. SaltStack's development team will be happy to back-port it to the correct branch.

**Please make sure you let the maintainers know that the pull request needs to be back-ported.**

---

### Main Release Branches

The current release branch is the most recent stable release. Pull requests containing bug fixes or documentation changes should be made against the oldest supported main release branch that is affected.

The branch name will be a date-based name such as `2016.11`.

Bug fixes are made on this branch so that dot release branches can be cut from the main release branch without introducing surprises and new features. This approach maximizes stability.

### Dot Release Branches

Prior to tagging an official release, a branch will be created when the SaltStack release team is ready to tag. The dot release branch is created from a main release branch. The dot release branch will be the same name as the tag minus the `v`. For example, the `2017.7.1` dot release branch was created from the `2017.7` main release branch. The `v2017.7.1` release was tagged at the HEAD of the `2017.7.1` branch.

This branching strategy will allow for more stability when there is a need for a re-tag during the testing phase of the release process and further increases stability.

Once the dot release branch is created, the fixes required for a given release, as determined by the SaltStack release team, will be added to this branch. All commits in this branch will be merged forward into the main release branch as well.

### Merge Forward Process

The Salt repository follows a "Merge Forward" policy. The merge-forward behavior means that changes submitted to older main release branches will automatically be "merged-forward" into the newer branches.

For example, a pull request is merged into `2017.7`. Then, the entire `2017.7` branch is merged-forward into the `2018.3` branch, and the `2018.3` branch is merged-forward into the `develop` branch.

This process makes it easy for contributors to make only one pull-request against an older branch, but allows the change to propagate to all **main** release branches.

The merge-forward work-flow applies to all main release branches and the operation runs continuously.

### Merge-Forwards for Dot Release Branches

The merge-forward policy applies to dot release branches as well, but has a slightly different behavior. If a change is submitted to a **dot** release branch, the dot release branch will be merged into its parent **main** release branch.

For example, a pull request is merged into the 2017.7.2 release branch. Then, the entire 2017.7.2 branch is merged-forward into the 2017.7 branch. From there, the merge forward process continues as normal.

The only way in which dot release branches differ from main release branches in regard to merge-forwards, is that once a dot release branch is created from the main release branch, the dot release branch does not receive merge forwards.

---

**Note:** The merge forward process for dot release branches is one-way: dot release branch -> main release branch.

---

### Closing GitHub issues from commits

This "merge-forward" strategy requires that the [magic keywords to close a GitHub issue](#) appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the *commit* containing the magic text is merged into the default branch (`develop`). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request text.

### Backporting Pull Requests

If a bug is fixed on `develop` and the bug is also present on a currently-supported release branch, it will need to be back-ported to an applicable branch.

---

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

---

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into `develop` (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into `develop`. And `upstream` is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.
2. Create a new branch for the back-port by reusing the same branch from the original pull request.

Name the branch `bp-<NNNN>` and use the number of the original pull request.

```
git fetch upstream refs/pull/1234/head:bp-1234
git checkout bp-1234
```

3. Find the parent commit of the original pull request.

The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending `~1` to the end.

4. Rebase the new branch on top of the release branch.

- `<release-branch>` is the branch identified in step #1.
- `<orig-base>` is the SHA identified in step #3 – don't forget to add `~1` to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to 2016.11 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

### 27.6.4 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
For ssh github
git remote add upstream git@github.com:saltstack/salt.git

For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin develop
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

### 27.6.5 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the [salt-users](#) mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### 27.6.6 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### 27.6.7 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

### 27.6.8 GPG Verification

SaltStack has enabled [GPG Probot](#) to enforce GPG signatures for all commits included in a Pull Request.

In order for the GPG verification status check to pass, *every* contributor in the pull request must:

- Set up a GPG key on local machine
- Sign all commits in the pull request with key
- Link key with GitHub account

This applies to all commits in the pull request.

GitHub hosts a number of [help articles](#) for creating a GPG key, using the GPG key with `git` locally, and linking the GPG key to your GitHub account. Once these steps are completed, the commit signing verification will look like the example in GitHub's [GPG Signature Verification feature announcement](#).

### 27.6.9 Bootstrap Script Changes

Salt's Bootstrap Script, known as `bootstrap-salt.sh` in the Salt repo, has it's own repository, contributing guidelines, and release cadence.

All changes to the Bootstrap Script should be made to [salt-bootstrap repo](#). Any pull requests made to the `bootstrap-salt.sh` file in the Salt repository will be automatically overwritten upon the next stable release of the Bootstrap Script.

For more information on the release process or how to contribute to the Bootstrap Script, see the Bootstrap Script's [Contributing Guidelines](#).

## 27.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.versions.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.versions.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
 if foo is not None:
 salt.utils.versions.warn_until(
 'Aluminum',
 'The \'foo\' argument has been deprecated and its '
 'functionality removed, as such, its usage is no longer '
 'required.'
)
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 27.8 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

---

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git 'fetch' utility:

```
git fetch --tags upstream
```

---

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable `pkg` and `portage_config` functionality

---

**Note:** Using system Python modules in the `virtualenv`

To use already-installed python modules in `virtualenv` (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system `PYTHONPATH` at the time of `virtualenv` creation.

---

**Note:** Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

---

Activate the `virtualenv`:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the `virtualenv`:

```
pip install pycmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt # the path to the salt git clone from above
```

---

**Note:** Installing `psutil`

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

---

**Note:** Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See [macOS Installation](#)

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

### 27.8.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. Uncomment and change the `pki_dir: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`
4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. Uncomment and change the `pki_dir: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
4. Uncomment and change the `master: salt` value to point at `localhost`.
5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

---

**Note:** Using `salt-call` with a *Standalone Minion*

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

---

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.version
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcf7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
check your current limit
ulimit -n

raise the limit. persists only until reboot
use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, refer to the [macOS Installation](#) instructions.

## Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/
↳virtualenv/' \
 -e ./salt # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

## Additional Options

If you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-
↳root-dir=/path/to/your/virtualenv/' \
-e ./salt # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/
↳virtualenv/' \
-e ./salt # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

## 27.8.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a `USE_SETUPTOOLS` environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

## 27.8.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The docs use `reStructuredText` for markup. See a live demo at <http://rst.ninjs.org/>.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

## 27.8.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See [here](#) for more information regarding the test suite.

## 27.8.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

## 27.9 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

### 27.9.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- **Approved** - The issue has been validated and has all necessary information.
- **Blocked** - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels Info Needed, Question, Expected Behavior, Won't Fix For Now, or Upstream Bug.

### 27.9.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

### Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

- **Feature** - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- **Bug** - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.
- **Duplicate** - The issue is a duplicate of another feature request or bug report.
- **Upstream Bug** - The issue is a result of an upstream issue.
- **Question** - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- **Expected Behavior** - The issue is a bug report of intended functionality.

### Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a **P1** label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- **P1** - The issue will be seen by all users.
- **P2** - The issue will be seen by most users.
- **P3** - The issue will be seen by about half of users.
- **P4** - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

### Severity

Severity labels are almost always only applied to issues labeled **Bug**.

- **Blocker** - The issue is blocking an impending release.
- **Critical** - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- **High Severity** - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- **Medium Severity** - The issue reports cosmetic items, formatting, spelling, colors, etc.

### Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- **Execution Module**

- File Servers
- Grains
- Multi-Master
- Packaging Related to packaging of Salt, not Salt's support for package management.
- Pillar
- RAET
- Returners
- Runners
- SPM
- Salt-API
- Salt-Cloud
- Salt-SSH
- Salt-Syndic
- State Module
- Tests
- Transport
- Windows
- ZMQ

### Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- **Core** - The issue or pull request relates to code that is central or existential to Salt itself.
- **Platform** - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.
- **RIoT** - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.
- **Console** - The issue or pull request relates to the SaltStack enterprise console.
- **Documentation** - The issue or pull request relates to documentation.

### Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the **Blocked** milestone, it is very likely that it will only have a status label.

- **Bugfix - back-port** The pull request needs to be back-ported to an older release branch. This is done by *recreating the pull request* against that branch. Once the back-port is completed, this label is replaced with a **Bugfix - [Done] back-ported** label. Normally, new features should go into the develop and bug fixes into the oldest supported release branch, see [here](#).
- **Bugfix - [Done] back-ported** - The pull request has been back-ported to an older branch.

- **Cannot Reproduce** - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.
- **Confirmed** - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.
- **Fixed Pending Verification** - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.
- **Info Needed** - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.
- **Pending Changes** - The pull request needs additional changes before it can be merged.
- **Pending Discussion** - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a **Pending Changes** label.

- **Won't Fix for Now** - The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

## Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

- **Minor Change**
  - Less than 64 lines changed, or
  - Less than 8 core lines changed
- **Medium Change**
  - Less than 256 lines changed, or
  - Less than 64 core lines changed
- **Master Change**
  - More than 256 lines changed, or
  - More than 64 core lines changed

- Expert Change
  - Needs specialized, in-depth review

### Test Status

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

- `Lint` - The pull request has passed all tests except for the code lint checker.
- `Tests Passed` - The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

### Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- `Awesome` - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- `Help Wanted` - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- `Needs Testcase` - The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.
- `Regression` - The issue is a bug that breaks functionality known to work in previous releases.
- `Story` - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- `Stretch` - The issue is an optional goal for the current sprint but may not be delivered.
- `ZD` - The issue is related to a Zendesk customer support ticket.
- `<Release>` - The issue is scheduled to be implemented by `<Release>`. See here for a discussion of Salt's release codenames.

## 27.10 Logging Internals

TODO

## 27.11 Package Providers

This page contains guidelines for writing package providers.

### 27.11.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

#### list\_pkgs

This function should declare an empty dict, and then add packages to it by calling *pkg\_resource.add\_pkg*, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute *pkg\_resource.sort\_pkglist*. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

*list\_pkgs* returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

#### latest\_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept *\*\*kwargs*, in order to receive the *fromrepo* and *repo* keyword arguments from *pkg* states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The *fromrepo* kwarg takes precedence over *repo*, so if both of those kwargs are present, the repository specified in *fromrepo* should be used. However, if *repo* is used instead of *fromrepo*, it should still work, to preserve backwards compatibility with older versions of Salt.

#### version

Like *latest\_version*, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

#### upgrade\_available

Deprecated and destined to be removed. For now, should just do the following:

```
return __salt__['pkg.latest_version'](name) != ''
```

## install

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call `pkg_resource.parse_targets` (see below). This function will convert the SLS input into a more easily parsed data structure. `pkg_resource.parse_targets` may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name,
 pkgs,
 sources)
```

Two values will be returned to the `install` function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If `name` was provided (and `pkgs` was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the `version` keyword argument was provided, then it should replace the `None` value in the dictionary.
- If `pkgs` was provided, then `name` is ignored, and the dictionary will contain one entry for each package in the `pkgs` list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the `pkg.installed` state for more info.
- If `sources` was provided, then `name` is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The `install` function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run `list_pkgs` to obtain a list of the installed packages. You should then return the output of `salt.utils.data.compare_dicts()`:

```
return salt.utils.data.compare_dicts(old, new)
```

## remove

Removes the passed package and return a list of the packages removed.

### 27.11.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

### list\_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
 'list item 2 (when appropriate)]}
```

### get\_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as `list_repos`, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
 'list item 2 (when appropriate)]}
```

### del\_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

### mod\_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

## 27.11.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkgs`, but `lowpkg` must never make calls to `pkg`. This affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

### list\_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

### verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
 'type': 'config'}}
```

### file\_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the `file_list` function name). However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],
 'files': ['/etc/httpd',
 '/etc/httpd/conf',
 '/etc/httpd/conf.d',
 '...SNIP...']}
```

### file\_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike *file\_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file\_list*.

```
{'errors': ['package apache is not installed'],
 'packages': {'httpd': ['/etc/httpd',
 '/etc/httpd/conf',
 '...SNIP...'],
 'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',
 '/boot/System.map-2.6.32-279.el6.x86_64',
 '...SNIP...']}}
```

## 27.12 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven't contributed to a large software project before we encourage you to consider the following questions when preparing a pull request.

This isn't an exhaustive list and these aren't necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?
- Will this code work on versions of all Python we support? Will it work on future versions?
- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what's going on?
- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?
- Is it readable? Does it conform to our [style guide](#)? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?
- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?
- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools.) Will it be easy to profile this change if it might be a problem?
- Are caveats considered and documented in the change?
- Will the code scale? More critically, will it scale in *both* directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.
- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn't work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?

- Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?
- How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?
- If it's asynchronous code, what is the potential for a race condition?
- Is this code an original work? If it's borrowed from another project or found online are the appropriate licensing/attribution considerations handled?
- Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.
- Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?
- Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?
- If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?
- Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?
- Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?
- Are resources such as file-handles cleaned-up after they are used?
- Is it possible that a reference-cycle exists between objects that will leak memory?
- Has the code been linted and does it pass all tests?
- Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?
- Will the code throw errors/warnings/stacktraces to the console during normal operation?
- Has all the debugging been removed?
- Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?
- Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?
- What's hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?
- Are utility functions used where appropriate? Does this change re-implement something we already have code for?

- Is the right thing being fixed? There are cases where it's appropriate to fix a test and cases where it's appropriate to fix the code that's under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?
- How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?
- Does this PR try to fix too many bugs/problems at once?
- Should this be split into multiple PRs to make them easier to test and reason about?

## 27.13 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the [new issue page for the Salt project](#).

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

---

**Note:** Please be certain to scrub any logs or SLS files for sensitive data!

---

## 27.14 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

### 27.14.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.

## 27.14.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

## 27.14.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

## 27.15 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the [Transifex](#) website and [signup](#) for an account.

Once registered, head over to the [Salt Translation Project](#), and either click on **Request Language** if you can't find yours, or, select the language for which you wish to contribute and click **Join Team**.

[Transifex](#) provides some useful reading resources on their [support domain](#), namely, some useful articles [directed to translators](#).

### 27.15.1 Building A Localized Version of the Documentation

While you're working on your translation on [Transifex](#), you might want to have a look at how it's rendering.

#### Install The Transifex Client

To interact with the [Transifex](#) web service you will need to install the `transifex-client`:

```
pip install transifex-client
```

#### Configure The Transifex Client

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
.scripts/setup-transifex-config
```

#### Download Remote Translations

There's a little script which simplifies the download process of the translations(which isn't that complicated in the first place). So, let's assume you're translating `pt_PT`, Portuguese(Portugal). To download the translations, execute from the `doc/` directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download `pt_PT`, Portuguese(Portugal), and `nl`, Dutch, you can use the helper script directly:

```
.scripts/download-translation-catalog pt_PT nl
```

### Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the pt\_PT example above:

```
make html SPHINXLANG=pt_PT
```

### View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you've just build.

## 27.16 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my\_account>)
- a command line (CLI)
- git
- a text editor

### 27.16.1 Fork

In your browser, navigate to the [saltstack/salt](https://github.com/saltstack/salt) GitHub repository.

Click on Fork (<https://github.com/saltstack/salt/#fork-destination-box>).

---

**Note:** If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

---

### 27.16.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where <my\_account> is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `develop` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/develop` so that we will get all upstream changes when they happen.

```
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

### 27.16.3 Fetch

Fetch any upstream changes on the `develop` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

**Note:** For an explanation on `pull` vs `pull --rebase` and other excellent points, see [this article](#) by Mislav Marohnić.

### 27.16.4 Branch

Now we are ready to get to work. Consult the [sprint beginner bug list](#) and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `develop`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

### 27.16.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
```

```
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
 """
 if os.path.isdir('/etc/alternatives'):
 return True
- return False
+ return (False, 'Cannot load alternatives module: /etc/alternatives dir not
↪found')

def _get_cmd():
```

## 27.16.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

---

**Note:** If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

---

## 27.16.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

---

**Note:** If authentication over https does not work, you can alternatively setup [ssh keys](#). Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

---

## 27.16.8 Merge

In your browser, navigate to the [new pull request](#) page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `develop` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

---

**Note:** Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:

```
https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret
```

---

## 27.16.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

<https://help.github.com/>

There are many topics covered by the Salt Developer documentation:

<https://docs.saltstack.com/en/latest/topics/development/index.html>

The contributing documentation presents more details on specific contributing topics:

<https://docs.saltstack.com/en/latest/topics/development/contributing.html>

## 27.17 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

### 27.17.1 Developing New Modules

#### Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
Debian
apt-get install ipython

Arch Linux
pacman -Syu ipython2

RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

## Special Module Contents

These are things that may be defined by the module to influence various things.

`__virtual__`

`__virtual_aliases__`

`__virtualname__`

`__init__`

Called before `__virtual__()`

`__proxyenabled__`

grains and proxy modules

`__proxyenabled__` as a list containing the names of the proxy types that the module supports.

`__load__`

`__func_alias__`

`__outputter__`

## Dunder Dictionaries

Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty

- `__context__`
- `__grains__`
- `__pillar__`
- `__opts__`

## `__opts__`

Defined in: All modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

---

**Note:** In many places in salt, instead of pulling raw data from the `__opts__` dict, configuration data should be pulled from the salt *get* functions such as `config.get`, aka - `__salt__['config.get']('foo:bar')` The *get* functions also allow for dict traversal via the `:` delimiter. Consider using *get* functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

---

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

## `__salt__`

Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

---

**Note:** When used in runners or outputters, `__salt__` references other runner/outputter modules, and not execution modules.

---

## `__grains__`

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

While `__grains__` is defined for every module, it's only filled in for some.

## `__pillar__`

Filled in for: Execution, Returner, SSH Wrapper, State

The `__pillar__` dictionary contains the pillar for the respective minion.

While `__pillar__` is defined for every module, it's only filled in for some.

## `__context__`

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not 'cp.fileclient' in __context__:
 __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

---

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

---

## `__utils__`

Defined in: Cloud, Engine, Execution, File Server, Pillar, Proxy, Runner, SDB.

## `__proxy__`

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

## `__runners__`

Defined in: Engine, Roster, Thorium

## `__ret__`

Defined in: Proxy, Search

## `__thorium__`

Defined in: Thorium

## `__states__`

Defined in: Renderers, State

## `__serializers__`

Defined in: State

## `__sdb__`

Defined in: SDB

### Additional Globals

Defined for: Runners, Execution Modules, Wheels

- `__jid__`: The job ID
- `__user__`: The user
- `__tag__`: The jid tag
- `__jid_event__`: A `salt.utils.event.NamespacedEvent`.

`NamespacedEvent` defines a single method `fire_event`, that takes data and tag. The [Runner docs](#) has examples.

### 27.17.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules` (*Minion*)
- `cython_enable` (*Minion, Master*)
- `disable_modules` (*Minion*)
- `disable_returners` (*Minion*)
- `enable_zip_modules` (*Minion*)
- `extension_modules` (*Master*)
- `extmod_whitelist` (*Minion, Master*)
- `extmod_blacklist` (*Minion, Master*)
- `whitelist_modules` (*Minion*)
- `grains_dirs` (*Minion*)
- `module_dirs` (*Minion, Master*)
- `outputter_dirs` (*Minion, Master*)
- `providers` (*Minion*)
- `render_dirs` (*Minion*)
- `returner_dirs` (*Minion*)
- `runner_dirs` (*Master*)
- `states_dirs` (*Minion*)
- `utils_dirs` (*Minion*)

### 27.17.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed

Using one source to override another is not supported.

#### The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don't require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

#### The Salt File Server

The user may add modules by simply placing them in special directories in their *fileserver*.

The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- `_grains`
- `_modules`
- `_states`

Modules must be synced before they can be used. This can happen a few ways, discussed below.

#### Sync Via States

The minion configuration contains an option `autoload_dynamic_modules` which defaults to `True`. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set `autoload_dynamic_modules` to `False` in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenvs as the states currently being run.

#### Sync Via the saltutil Module

The `saltutil` module has a number of functions that can be used to sync all or specific dynamic modules. The `saltutil.sync_*execution functions` and `runner functions` can be used to sync modules to minions and the master, respectively.

#### The extmods Directory

Any files placed in the directory set by `extension_modules` settings (minion, *master*, default `/var/cache/salt/*/extmods`) can also be loaded as modules. Note that these directories are also used by the `saltutil.sync_*` functions (mentioned above) and files may be overwritten.

## Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```

setup(
 # ...
 entry_points={
 'salt.loader': [
 'module_dirs=spirofs.loader:module',
],
 },
 # ...
)

```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

### 27.17.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

| Module Type | Salt Package Name                               | FS/Directory Name                   | Entry Point                    |
|-------------|-------------------------------------------------|-------------------------------------|--------------------------------|
| Auth        | <code>salt.auth</code> ( <i>index</i> )         | <code>auth</code> <sup>1</sup>      | <code>auth_dirs</code>         |
| Beacon      | <code>salt.beacons</code> ( <i>index</i> )      | <code>beacons</code>                | <code>beacons_dirs</code>      |
| Cache       | <code>salt.cache</code> ( <i>index</i> )        | <code>cache</code>                  | <code>cache_dirs</code>        |
| Cloud       | <code>salt.cloud.clouds</code> ( <i>index</i> ) | <code>clouds</code>                 | <code>cloud_dirs</code>        |
| Engine      | <code>salt.engines</code> ( <i>index</i> )      | <code>engines</code>                | <code>engines_dirs</code>      |
| Execution   | <code>salt.modules</code> ( <i>index</i> )      | <code>modules</code>                | <code>module_dirs</code>       |
| Executor    | <code>salt.executors</code> ( <i>index</i> )    | <code>executors</code> <sup>1</sup> | <code>executor_dirs</code>     |
| File Server | <code>salt.fileserver</code> ( <i>index</i> )   | <code>fileserver</code>             | <code>fileserver_dirs</code>   |
| Grain       | <code>salt.grains</code> ( <i>index</i> )       | <code>grains</code>                 | <code>grains_dirs</code>       |
| Log Handler | <code>salt.log.handlers</code> ( <i>index</i> ) | <code>log_handlers</code>           | <code>log_handlers_dirs</code> |
| Net API     | <code>salt.netapi</code> ( <i>index</i> )       | <code>netapi</code> <sup>1</sup>    | <code>netapi_dirs</code>       |
| Outputter   | <code>salt.output</code> ( <i>index</i> )       | <code>output</code>                 | <code>outputter_dirs</code>    |
| Pillar      | <code>salt.pillar</code> ( <i>index</i> )       | <code>pillar</code>                 | <code>pillar_dirs</code>       |
| Proxy       | <code>salt.proxy</code> ( <i>index</i> )        | <code>proxy</code>                  | <code>proxy_dirs</code>        |
| Queue       | <code>salt.queues</code> ( <i>index</i> )       | <code>queues</code>                 | <code>queue_dirs</code>        |
| Renderer    | <code>salt.renderers</code> ( <i>index</i> )    | <code>renderers</code>              | <code>render_dirs</code>       |
| Returner    | <code>salt.returners</code> ( <i>index</i> )    | <code>returners</code>              | <code>returner_dirs</code>     |
| Roster      | <code>salt.roster</code> ( <i>index</i> )       | <code>roster</code>                 | <code>roster_dirs</code>       |

## Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the *pam* module as an example.

See *External Authentication System* for more about authentication in Salt.

## Beacon

- *Writing Beacons*

Beacons are polled by the Salt event loop to monitor non-salt processes. See *Beacons* for more information about the beacon system.

## Cache

The minion cache is used by the master to store various information about minions. See *Minion Data Cache* for more information.

## Cloud

Cloud modules are backend implementations used by *Salt Cloud*.

## Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See *Salt Engines* for complete details.

## Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

---

<sup>1</sup> These modules cannot be loaded from the Salt File Server.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

## Executor

Executors control how execution modules get called. The default is to just call them, but this can be customized.

## File Server

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example.

See *File Server Backends* for more information.

## Grains

- *Writing Grains*

Grain modules define extra routines to populate grains data. All defined public functions will be executed and **MUST** return a Python dict object. The dict keys will be added to the grains made available to the minion.

See *Grains* for more.

## Log Handler

Log handlers allows the logs from salt (master or minion) to be sent to log aggregation systems.

## Net API

Net API modules are the actual server implementation used by Salt API.

## Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the `nested` module.

## Pillar

### External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

## Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

## Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
- example_a: some argument
- example_b:
 - argumentA
 - argumentB
- example_c:
 keyA: valueA
 keyB: valueB
```

## The Module

### Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
 import weird_thing
 EXAMPLE_A_LOADED = True
except ImportError:
 EXAMPLE_A_LOADED = False
```

### Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

### Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__(__opts__):
 # Do init work here
```

**Note:** The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

## `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
This external pillar will be known as `example_a`
def __virtual__():
 if EXAMPLE_A_LOADED:
 return True
 return False
```

```
This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
 if EXAMPLE_A_LOADED:
 return __virtualname__
 return False
```

## `ext_pillar`

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar(id, pillar, 'some argument') # example_a
ext_pillar(id, pillar, 'argumentA', 'argumentB') # example_b
ext_pillar(id, pillar, keyA='valueA', keyB='valueB') # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note:** this function is called once for each minion that fetches its pillar data.

```
def ext_pillar(minion_id, pillar, *args, **kwargs):

 my_pillar = {'external_pillar': {}}
```

(continues on next page)

(continued from previous page)

```
my_pillar['external_pillar'] = get_external_pillar_dictionary()

return my_pillar
```

You can call `pillar` with the dictionary's top name to retrieve its data. From above example, `'external_pillar'` is the top dictionary name. Therefore:

```
salt-call '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__` A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__` A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` Note, runs on the *master*
- `__grains__` A dictionary of the grains of the minion making this pillar call.

### Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
- cmd_json: 'echo {"arg\":\"value\"}'
```

### Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

### Proxy

*Proxy Minions* are a way to manage devices that cannot run a full minion directly.

### Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the `py` renderer and as complex as `stateconf` and `pydsl`.

## Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

## Roster

The *Roster system* is used by Salt SSH to enumerate devices.

## Runners

Runners are purely master-side execution sequences.

## SDB

- *Writing SDB Modules*

SDB is a way to store data that's not associated with a minion. See *Storing Data in Other Databases*.

## Serializer

Primarily used with *file.serialize*.

## State

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

---

**Note:** State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

---

## SPM pkgdb

- *SPM Development Guide: Package Database*

pkgdb modules provides storage backends to the package database.

## SPM pkgfiles

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.

## SSH Wrapper

Replacement execution modules for *Salt SSH*.

## Thorium

Modules for use in the *Thorium* event reactor.

## Tokens

Token stores for *External Authentication*. See the `salt.tokens` docstring for details.

## Tops

Tops modules are used to convert external data sources into top file data for the state system.

## Util

Just utility modules to use with other modules via `__utils__` (see *Dunder Dictionaries*).

## Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

## 27.18 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

### 27.18.1 Command line usage

See *salt-extend*

### 27.18.2 Choosing a template

The following templates are available:

#### **module**

Creates a new execution module within `salt/modules/{{module_name}}.py`

#### **module\_unit**

Creates a new execution module unit test suite within `tests/unit/modules/test_{{module_name}}.py`

**state**

Creates a new state module within salt/states/{{module\_name}}.py

**state\_unit**

Creates a new state module unit test suite within tests/unit/states/test\_{{module\_name}}.py

**27.18.3 Adding templates**

1. Create a directory under <src>/templates
2. Create a file `template.yml` containing properties for
  - `description` - a description of the template
  - `questions` - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
    - `question` - The question to ask the user, as a string
    - `default` - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

**Example template.yml**

```
description: "Execution module"
questions:
 depending_libraries:
 question: "What libraries does this module depend upon?"
 virtual_name:
 question: "What module virtual name to use?"
 default: "{{module_name}}"
```

3. Create the files within <src>/templates/<your template> to match the target

---

**Note:** File names can contain Jinja 2 template syntax, e.g. `'{{module_name}}.py'`

---

**Example file in the template directory**

```
print('Hello {{module_name}}')
__virtual__ = '{{__virtual_name__}}'
```

**Default context properties**

The default context provides the following properties

- `description` - A description of the template
- `short_description` - A short description of the module as entered by the user
- `version` - The version name of the next release

- `module_name` - The module name as entered by the user
- `release_date` - The current date in the format `YYYY-MM-DD`
- `year` - The current year in the format `YYYY`

As well as any additional properties entered from the questions section of `template.yml`

## 27.18.4 API

### `salt.utils.extend` module

#### SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using `salt-extend`

**codeauthor** Anthony Shaw <[anthonyshaw@apache.org](mailto:anthonyshaw@apache.org)>

`salt.utils.extend.apply_template` (*template\_dir*, *output\_dir*, *context*)

Apply the template from the template directory to the output using the supplied context dict.

#### Parameters

- **src** (str) - The source path
- **dst** (str) - The destination path
- **context** (dict) - The dictionary to inject into the Jinja template as context

`salt.utils.extend.run` (*extension=None*, *name=None*, *description=None*, *salt\_dir=None*, *merge=False*, *temp\_dir=None*)

A template factory for extending the salt ecosystem

#### Parameters

- **extension** (str) - The extension type, e.g. 'module', 'state', if omitted, user will be prompted
- **name** (str) - Python-friendly name for the module, if omitted, user will be prompted
- **description** (str) - A description of the extension, if omitted, user will be prompted
- **salt\_dir** (str) - The targeted Salt source directory
- **merge** (bool) - Merge with salt directory, *False* to keep separate, *True* to merge trees.
- **temp\_dir** (str) - The directory for generated code, if omitted, system temp will be used

## 27.19 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt's test suite works, be sure to check out the [Salt's Test Suite: An Introduction](#) tutorial.

### 27.19.1 Test Directory Structure

Salt's test suite is located in the `tests` directory in the root of Salt's codebase. The test suite is divided into two main groups:

- [Integration Tests](#)
- [Unit Tests](#)

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

---

**Note:** Salt's test framework provides for the option to only run tests which correspond to a given file (or set of files), via the `--from-filenames` argument to `runtests.py`:

```
python /path/to/runtests.py --from-filenames=salt/modules/foo.py
```

Therefore, where possible, test files should be named to match the source files they are testing. For example, when writing tests for `salt/modules/foo.py`, unit tests should go into `tests/unit/modules/test_foo.py`, and integration tests should go into `tests/integration/modules/test_foo.py`.

However, integration tests are organized differently from unit tests, and this may not always be plausible. In these cases, to ensure that the proper tests are run for these files, they must be mapped in `tests/filename_map.yml`.

The filename map is used to supplement the test framework's filename matching logic. This allows one to ensure that states corresponding to an execution module are also tested when `--from-filenames` includes that execution module. It can also be used for those cases where the path to a test file doesn't correspond directly to the file which is being tested (e.g. the `shell`, `spm`, and `ssh` integration tests, among others). Both glob expressions and regular expressions are permitted in the filename map.

---

**Important:** Test modules which don't map directly to the source file they are testing (using the naming convention described above), **must** be added to the `ignore` tuple in `tests/unit/test_module_names.py`, in the `test_module_name_source_match` function. This unit test ensures that we maintain the naming convention for test files.

---

## Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the [Integration vs. Unit](#) section of the [testing tutorial](#) is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- [Integration Test Documentation](#)

## Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's

logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- [Unit Test Documentation](#)

## 27.19.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python27.txt
pip install -r requirements/dev_python34.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run *unit tests only*: `python tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py -n unit.modules.virt_test`

- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `python tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the [Test Selection Options](#) documentation or the [Running Specific Tests](#) section of the *Salt's Test Suite: An Introduction* tutorial.

### Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the `runtests.py` script with `--unit` argument:

```
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

### Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

---

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

---

To run tests marked as destructive, set the `--run-destructive` flag:

```
python tests/runtests.py --run-destructive
```

### Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
 driver: digitalocean
 client_key: ''
```

(continues on next page)

(continued from previous page)

```
api_key: ''
location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
driver: digitalocean
client_key: wFGEwgregeqw3435gDger
api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
location: New York 1
```

**Note:** When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

### Running The Tests In A Docker Container

The test suite can be executed under a `docker` container using the `--docked` option flag. The `docker` container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
python tests/runtests.py --docked=ubuntu-12.04 -v
```

The full `docker` container repository can also be provided:

```
python tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt's [docker repository](#).

Custom `docker` containers can be provided by submitting a pull request against Salt's [docker Salt test containers repository](#).

### 27.19.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then be merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to <http://jenkins.saltstack.com>.

## Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: <https://github.com/saltstack/salt/blob/develop/tests/jenkins.py>

## 27.19.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- *Writing integration tests*
- *Writing unit tests*

## Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

## Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

## Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `develop` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `develop` branch, then the tests should be added there as well. However, if the feature was added to `develop` some time ago and is already present in one or more release branches, please refer to the [Tests for Entire Files or Functions](#) section below for more details about where to submit tests for functions or files that do not already have tests.

## Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the [Which Salt Branch?](#) documentation in Salt's [Contributing](#) guide.

## Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `develop` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

---

**Note:** If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

---

## Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported in `tests.support.helpers`.

`@expensiveTest` – Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.

`@destructiveTest` – Marks a test as potentially destructive. It will not be run by the test runner unless the `-run-destructive` test is expressly passed.

`@requires_network` – Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.

`@requires_salt_modules` – Requires all the modules in a list of modules in order for the test to be executed. Otherwise, the test is skipped.

*@requires\_system\_grains* – Loads and passes the grains on the system as a keyword argument to the test function with the name *grains*.

*@skip\_if\_binaries\_missing(['list', 'of', 'binaries'])* – If called from inside a test, the test will be skipped if the binaries are not all present on the system.

*@skip\_if\_not\_root* – If the test is not executed as root, it will be skipped.

*@with\_system\_user* – Creates and optionally destroys a system user within a test case. See implementation details in *tests.support.helpers* for details.

*@with\_system\_group* – Creates and optionally destroys a system group within a test case. See implementation details in *tests.support.helpers* for details.

*@with\_system\_user\_and\_group* – Creates and optionally destroys a system user and group within a test case. See implementation details in *tests.support.helpers* for details.

## 27.20 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.

The integration system is all located under `tests/integration` in the Salt source tree. Each directory within `tests/integration` corresponds to a directory in Salt's tree structure. For example, the integration tests for the `test.py` Salt module that is located in `salt/modules` should also be named `test.py` and reside in `tests/integration/modules`.

### 27.20.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *test subsections*, and running a single integration test file, class, or individual test.

### 27.20.2 Best Practices

Integration tests should be written to the following specifications.

#### What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Individual tests should test against a single behavior.

- Since it occasionally takes some effort to “set up” an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

## Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a “normal” function and is not considered a testing function. It will not be included in the test run or testing output.

## The `setUp` and `tearDown` Functions

There are two special functions that can be utilized in the integration side of Salt’s test suite: `setUp` and `tearDown`. While these functions are not required in all test files, there are many examples in Salt’s integration test suite illustrating the broad usefulness of each function.

The `setUp` function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the `mac_*` integration tests should only run on macOS machines. The `setUp` function can be used to test for the presence of the Darwin kernel. If the Darwin kernel is not present, then the test should be skipped.

```
def setUp(self):
 """
 Sets up test requirements
 """
 os_grain = self.run_function('grains.item', ['kernel'])
 if os_grain['kernel'] not in 'Darwin':
 self.skipTest(
 'Test not applicable to \'{kernel}\'' kernel'.format(
 **os_grain
)
)
```

The `setUp` function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The `tearDown` function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

---

**Note:** The `setUp` and `tearDown` functions run before and after each test in the test class that the `setUp` and `tearDown` functions are defined.

---

Be sure to read the [Destructive vs Non-Destructive Tests](#) section when using any kind of destructive functions that might alter the system running the test suite in either the `setUp` or `tearDown` function definitions.

## Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any `setUp` or `tearDown` functions are defined in the class, those functions will run before (for `setUp`) or after (for `tearDown`) each test case.

### 27.20.3 Integration Classes

The integration classes are located in `tests/integration/__init__.py` and can be extended therein. There are four classes available to extend:

- *ModuleCase*
- *ShellCase*
- *SSHCase*
- *SyndicCase*

#### ModuleCase

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:

##### **run\_function**

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

##### **run\_state**

Run the state.single command and return the state return structure.

##### **minion\_run**

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

#### ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

##### **run\_cp**

Execute salt-cp. Pass in the argument string as it would be passed on the command line.

### **run\_call**

Execute salt-call, pass in the argument string as it would be passed on the command line.

### **run\_cloud**

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

### **run\_key**

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

### **run\_run**

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

### **run\_run\_plus**

Execute the runner function the and return the return data and output in a dict

### **run\_salt**

Execute the salt command. Pass in the argument string as it would be passed on the command line.

### **run\_script**

Execute a salt script with the given argument string.

### **run\_ssh**

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

### **SSHCase**

Used to execute remote commands via salt-ssh. The available methods are as follows:

#### **run\_function**

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

### **SyndicCase**

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:

## run\_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

### 27.20.4 Examples

The following sections define simple integration tests present in Salt's integration test suite for each type of testing class.

#### Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the `integration.ModuleCase` class.

Now the workhorse method `run_function` can be used to test a module:

```
import os
import tests.integration as integration

class TestModuleTest(integration.ModuleCase):
 '''
 Validate the test module
 '''
 def test_ping(self):
 '''
 test.ping
 '''
 self.assertTrue(self.run_function('test.ping'))

 def test_echo(self):
 '''
 test.echo
 '''
 self.assertEqual(self.run_function('test.echo', ['text']), 'text')
```

The first example illustrates the testing master issuing a `test.ping` call to a testing minion. The test asserts that the minion returned with a `True` value to the master from the `test.ping` call.

The second example similarly verifies that the minion executed the `test.echo` command with the `text` argument. The `assertEqual` call maintains that the minion ran the function and returned the data as expected to the master.

#### Shell Example via ShellCase

Validating the shell commands can be done via shell tests:

```
import sys
import shutil
import tempfile

import tests.integration as integration

class KeyTest(integration.ShellCase):
```

(continues on next page)

(continued from previous page)

```

'''
Test salt-key script
'''

_call_binary_ = 'salt-key'

def test_list(self):
 '''
 test salt-key -L
 '''
 data = self.run_key('-L')
 expect = [
 'Unaccepted Keys:',
 'Accepted Keys:',
 'minion',
 'sub_minion',
 'Rejected:', '']
 self.assertEqual(data, expect)

```

This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key` method.

### SSH Example via SSHCase

Testing `salt-ssh` functionality can be done using the `SSHCase` test class:

```

import tests.integration as integration

class SSHGrainsTest(integration.SSHCase):
 '''
 Test salt-ssh grains functionality
 Depend on proper environment set by integration.SSHCase class
 '''

 def test_grains_id(self):
 '''
 Test salt-ssh grains id work for localhost.
 '''
 cmd = self.run_function('grains.get', ['id'])
 self.assertEqual(cmd, 'localhost')

```

### Testing Event System via SaltMinionEventAssertsMixin

The fundamentally asynchronous nature of Salt makes testing the event system a challenge. The `SaltMinionEventAssertsMixin` provides a facility for testing that events were received on a minion event bus.

```

import tests.integration as integration
import salt.utils.event

class TestEvent(integration.SaltEventAssertsMixin):
 '''
 Example test of firing an event and receiving it
 '''

```

(continues on next page)

(continued from previous page)

```

def test_event(self):
 e = salt.utils.event.get_event('minion', sock_dir=self.minion_opts['sock_dir']
 ↪), opts=self.minion_opts)

 e.fire_event({'a': 'b'}, '/test_event')

 self.assertMinionEventReceived({'a': 'b'})

```

### Syndic Example via SyndicCase

Testing Salt's Syndic can be done via the SyndicCase test class:

```

import tests.integration as integration

class TestSyndic(integration.SyndicCase):
 '''
 Validate the syndic interface by testing the test module
 '''
 def test_ping(self):
 '''
 test.ping
 '''
 self.assertTrue(self.run_function('test.ping'))

```

This example verifies that a `test.ping` command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the `run_function` located within the `SyndicCase` test class.

### 27.20.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named `files` to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within `tests/integration/files` contain files that accomplish different tasks, based on the needs of the integration tests using those files. For example, `tests/integration/files/ssh` is used to bootstrap the test runner for salt-ssh testing, while `tests/integration/files/pillar` contains files storing data needed to test various pillar functions.

The `tests/integration/files` directory also includes an integration state tree. The integration state tree can be found at `tests/integration/files/file/base`.

The following example demonstrates how integration files can be used with `ModuleCase` to test states:

```

Import python libs
from __future__ import absolute_import
import os
import shutil

Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin

```

(continues on next page)

```

Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, 'hosts')

class HostTest(ModuleCase, SaltReturnAssertsMixin):
 '''
 Validate the host state
 '''

 def setUp(self):
 shutil.copyfile(os.path.join(FILE, 'hosts'), HFILE)
 super(HostTest, self).setUp()

 def tearDown(self):
 if os.path.exists(HFILE):
 os.remove(HFILE)
 super(HostTest, self).tearDown()

 def test_present(self):
 '''
 host.present
 '''
 name = 'spam.bacon'
 ip = '10.10.10.10'
 ret = self.run_state('host.present', name=name, ip=ip)
 self.assertSaltTrueReturn(ret)
 with salt.utils.files.fopen(HFILE) as fp_:
 output = fp_.read()
 self.assertIn('{0}\t\t{1}'.format(ip, name), output)

```

To access the integration files, a variable named FILES points to the tests/integration/files directory. This is where the referenced host.present sls file resides.

In addition to the static files in the integration state tree, the location TMP can also be used to store temporary files that the test system will clean up when the execution finishes.

### 27.20.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the @destructive decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:

```

import tests.integration as integration
from tests.support.helpers import destructiveTest, skip_if_not_root

class DestructiveExampleModuleTest(integration.ModuleCase):
 '''
 Demonstrate a destructive test
 '''

 @destructiveTest
 @skip_if_not_root
 def test_user_not_present(self):
 '''
 This is a DESTRUCTIVE TEST it creates a new user on the minion.
 And then destroys that user.
 '''
 ret = self.run_state('user.present', name='salt_test')
 self.assertSaltTrueReturn(ret)
 ret = self.run_state('user.absent', name='salt_test')
 self.assertSaltTrueReturn(ret)

```

### 27.20.7 Cloud Provider Tests

Cloud provider integration tests are used to assess *Salt-Cloud*'s ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the `tests/integration/cloud/providers/` directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at `tests/integration/files/conf/cloud.*.d/`.

The following is an example of the default profile configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.profiles.d/digitalocean.conf`:

```

digitalocean-test:
 provider: digitalocean-config
 image: Ubuntu 14.04 x64
 size: 512MB

```

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.providers.d/digitalocean.conf`:

```

digitalocean-config:
 driver: digitalocean
 client_key: ''
 api_key: ''
 location: New York 1

```

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class's `setUp` function:

```

from tests.support.case import ShellCase
from tests.support.paths import FILES

```

(continues on next page)

(continued from previous page)

```

class LinodeTest(ShellCase):
 '''
 Integration tests for the Linode cloud provider in Salt-Cloud
 '''

 def setUp(self):
 '''
 Sets up the test requirements
 '''
 super(LinodeTest, self).setUp()

 # check if appropriate cloud provider and profile files are present
 profile_str = 'linode-config:'
 provider = 'linode'
 providers = self.run_cloud('--list-providers')
 if profile_str not in providers:
 self.skipTest(
 'Configuration file for {0} was not found. Check {0}.conf files '
 'in tests/integration/files/conf/cloud.*.d/ to run these tests.'
 .format(provider)
)

 # check if apikey and password are present
 path = os.path.join(FILESDIR,
 'conf',
 'cloud.providers.d',
 provider + '.conf')
 config = cloud_providers_config(path)
 api = config['linode-config']['linode']['apikey']
 password = config['linode-config']['linode']['password']
 if api == '' or password == '':
 self.skipTest(
 'An api key and password must be provided to run these tests. Check '
 'tests/integration/files/conf/cloud.providers.d/{0}.conf'.format(
 provider
)
)

```

Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are off by default and do not run automatically. To run the cloud provider tests, the `--cloud-provider-tests` flag must be provided:

```
./tests/runtests.py --cloud-provider-tests
```

Since cloud provider tests do not run automatically, all provider tests must be preceded with the `@expensiveTest` decorator. The expensive test decorator is necessary because it signals to the test suite that the `--cloud-provider-tests` flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the `expensiveTest` decorator for the test function:

```

from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
 '''

```

(continues on next page)

(continued from previous page)

```
Test creating an instance on Linode
'''
name = 'linode-testing'

create the instance
instance = self.run_cloud('-p linode-test {0}'.format(name))
str = ' {0}'.format(name)

check if instance with salt installed returned as expected
try:
 self.assertIn(str, instance)
except AssertionError:
 self.run_cloud('-d {0} --assume-yes'.format(name))
 raise

delete the instance
delete = self.run_cloud('-d {0} --assume-yes'.format(name))
str = ' True'
try:
 self.assertIn(str, delete)
except AssertionError:
 raise
```

## 27.20.8 Adding New Directories

If the corresponding Salt directory does not exist within `tests/integration`, the new directory must be created along with the appropriate test file to maintain Salt's testing directory structure.

In order for Salt's test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to `tests/runtests.py`. Examples of the necessary options that must be added can be found here: <https://github.com/saltstack/salt/blob/develop/tests/runtests.py>. The functions that need to be edited are `setup_additional_options`, `validate_options`, and `run_integration_tests`.

## 27.21 Writing Unit Tests

### 27.21.1 Introduction

Like many software projects, Salt has two broad-based testing approaches – integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function's logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.

Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.

### 27.21.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *unit test subsection*, running the unit tests *without testing daemons* to speed up development wait times, and running a unit test file, class, or individual test.

### 27.21.3 Best Practices

Unit tests should be written to the following specifications.

#### What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function's logic. The following guidelines should be followed when writing unit tests for Salt's test suite:

- Each `raise` and `return` statement needs to be independently tested.
- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Test functions should contain only one assertion.
- Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn't any logic present in a simple execution module, consider writing an *integration test* instead of heavily mocking a call to an external dependency.

#### Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.

- Test functions should contain only one assertion and all necessary mock code and data for that assertion.
- External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn't mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
- Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.
- Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function's logic.

## Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, `__salt__`, `__opts__`, `__pillar__`, etc. To facilitate testing these modules a mixin class was created, `LoaderModuleMockMixin` which can be found in `tests/support/mixins.py`. The reason for the existence of this class is because historically and because it was easier, one would add these dunder variables directly on the imported module. This however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that's exactly what this mixin class does.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```
import salt.modules.somemodule as somemodule

class SomeModuleTest(TestCase, LoaderModuleMockMixin):

 def setup_loader_modules(self):
 return {
 somemodule: {
 '__opts__': {'test': True}
 }
 }
```

Consider this more extensive example from `tests/unit/modules/test_libcloud_dns.py`:

```
Import Python Libs
from __future__ import absolute_import

Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch,
 MagicMock,
 NO_MOCK,
 NO_MOCK_REASON
)
import salt.modules.libcloud_dns as libcloud_dns

class MockDNSDriver(object):
 def __init__(self):
 pass

def get_mock_driver():
 return MockDNSDriver()

@skipIf(NO_MOCK, NO_MOCK_REASON)
@patch('salt.modules.libcloud_dns._get_driver',
 MagicMock(return_value=MockDNSDriver()))
class LibcloudDnsModuleTestCase(TestCase, LoaderModuleMockMixin):

 def setup_loader_modules(self):
 module_globals = {
```

(continues on next page)

(continued from previous page)

```

 '__salt__': {
 'config.option': MagicMock(return_value={
 'test': {
 'driver': 'test',
 'key': '2orgk34kgk34g'
 }
 })
 }
}
if libcloud_dns.HAS_LIBCLOUD is False:
 module_globals['sys.modules'] = {'libcloud': MagicMock()}

return {libcloud_dns: module_globals}

```

What happens in the above example is we mock a call to `__salt__['config.option']` to return the configuration needed for the execution of the tests. Additionally, if the `libcloud` library is not available, since that's not actually part of what's being tested, we mocked that import by patching `sys.modules` when tests are running.

## Mocking Filehandles

**Note:** This documentation applies to the 2018.3 release cycle and newer. The extended functionality for `mock_open` described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using `salt.utils.files.fopen()`. When testing code that reads from files, the `mock_open` helper can be used to mock filehandles. Note that is not the same `mock_open` as `unittest.mock.mock_open()` from the Python standard library, but rather a separate implementation which has additional functionality.

```

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch
 mock_open,
 NO_MOCK,
 NO_MOCK_REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):

 def test_something(self):
 fopen_mock = mock_open(read_data='foo\nbar\nbaz\n')
 with patch('salt.utils.files.fopen', fopen_mock):
 result = mymod.myfunc()
 assert result is True

```

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

### Important: String Types

When running tests on Python 2, `mock_open` will convert any `unicode` types to `str` types to more closely reproduce Python 2 behavior (file reads are always `str` types in Python 2, irrespective of mode).

However, when configuring your `read_data`, make sure that you are using bytestrings (e.g. `b'foo\nbar\nbaz\n'`) when the code you are testing is opening a file for binary reading, otherwise the tests will fail on Python 3. The mocked filehandles produced by `mock_open` will raise a `TypeError` if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be "written" if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

## More Complex Scenarios

### Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass `read_data` as a dictionary:

```
import textwrap

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch,
 mock_open,
 NO_MOCK,
 NO_MOCK_REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):

 def test_something(self):
 contents = {
 '/etc/foo.conf': textwrap.dedent('''\
 foo
 bar
 baz
 '''),
 '/etc/b*.conf': textwrap.dedent('''\
 one
 two
 three
 '''),
 }
 fopen_mock = mock_open(read_data=contents)
 with patch('salt.utils.files.fopen', fopen_mock):
 result = mymod.myfunc()
 assert result is True
```

This would make `salt.utils.files.fopen()` produce filehandles with different contents depending on which file was being opened by the code being tested. `/etc/foo.conf` and any file matching the pattern `/etc/b*.conf` would work, while opening any other path would result in a `FileNotFoundError` being raised (in Python 2, an `IOError`).

Since file patterns are supported, it is possible to use a pattern of `'*'` to define a fallback if no other patterns match the filename being opened. The below two `mock_open` calls would produce identical results:

```
mock_open(read_data='foo\n')
mock_open(read_data={'*': 'foo\n'})
```

**Note:** Take care when specifying the `read_data` as a dictionary, in cases where the patterns overlap (e.g. when both `/etc/b*.conf` and `/etc/bar.conf` are in the `read_data`). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of `*` which is used when no other pattern matches. If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an `OrderedDict` can be used to ensure matching is handled in the desired way:

```
contents = OrderedDict()
contents['/etc/bar.conf'] = 'foo\nbar\nbaz\n'
contents['/etc/b*.conf'] = IOError(errno.EACCES, 'Permission denied')
contents['*'] = 'This is a fallback for files not beginning with "/etc/b"\n'
fopen_mock = mock_open(read_data=contents)
```

## Raising Exceptions

Instead of a string, an exception can also be used as the `read_data`:

```
import errno

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch,
 mock_open,
 NO MOCK,
 NO MOCK REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO MOCK, NO MOCK REASON)
class MyAwesomeTestCase(TestCase):

 def test_something(self):
 exc = IOError(errno.EACCES, 'Permission denied')
 fopen_mock = mock_open(read_data=exc)
 with patch('salt.utils.files.fopen', fopen_mock):
 mymod.myfunc()
```

The above example would raise the specified exception when any file is opened. The expectation would be that `mymod.myfunc()` would gracefully handle the `IOError`, so a failure to do that would result in it being raised and causing the test to fail.

## Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function's behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the the contents for that file as a list. Each time the file is opened, `mock_open` will cycle through the list and produce a mocked filehandle with the specified contents. For example:

```

import errno
import textwrap

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch
 mock_open,
 NO_MOCK,
 NO_MOCK_REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):

 def test_something(self):
 contents = {
 '/etc/foo.conf': [
 textwrap.dedent('''\
 foo
 bar
 '''),
 textwrap.dedent('''\
 foo
 bar
 baz
 '''),
],
 '/etc/b*.conf': [
 IOError(errno.ENOENT, 'No such file or directory'),
 textwrap.dedent('''\
 one
 two
 three
 '''),
],
 }
 fopen_mock = mock_open(read_data=contents)
 with patch('salt.utils.files.fopen', fopen_mock):
 result = mymod.myfunc()
 assert result is True

```

Using this example, the first time `/etc/foo.conf` is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file's contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a `RuntimeError`. In the example above, if `/etc/foo.conf` were to be opened a third time, a `RuntimeError` would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if `/etc/bar.conf` were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

**Note:** Notice that the second path in the `contents` dictionary above (`/etc/b*.conf`) contains an asterisk. The items in the list are cycled through for each match of a given pattern (*not* separately for each individual file path), so this means that only two files matching that pattern could be opened before the next one would raise a

---

RuntimeError.

---

### Accessing the Mocked Filehandles in a Test

---

**Note:** The code for the `MockOpen`, `MockCall`, and `MockFH` classes (referenced below) can be found in `tests/support/mock.py`. There are extensive unit tests for them located in `tests/unit/test_mock.py`.

---

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```
fopen_mock = mock_open(read_data='foo\nbar\nbaz\n')
with patch('salt.utils.files.fopen', fopen_mock) as m_open:
 # do testing here
 ...
 ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- **read\_data** - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that *multiple file paths* are not used, then this will be a dictionary mapping \* to the `read_data` passed to `mock_open`.
- **call\_count** - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.
- **calls** - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.

```
from tests.support.unit import TestCase, skipIf
from tests.support.mock import (
 patch
 mock_open,
 MockCall,
 NO_MOCK,
 NO_MOCK_REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):

 def test_something(self):

 with patch('salt.utils.files.fopen', mock_open(read_data=b'foo\n')) as m_
↪open:
 mymod.myfunc()
 # Assert that only two opens attempted
 assert m_open.call_count == 2
 # Assert that only /etc/foo.conf was opened
 assert all(call.args[0] == '/etc/foo.conf' for call in m_open.calls)
 # Asser that the first open was for binary read, and the
```

(continues on next page)

(continued from previous page)

```

second was for binary write.
assert m_open.calls == [
 MockCall('/etc/foo.conf', 'rb'),
 MockCall('/etc/foo.conf', 'wb'),
]

```

Note that `MockCall` is imported from `tests.support.mock` in the above example. Also, the second `assert` above is redundant since it is covered in the final `assert`, but both are included simply as an example.

- **filehandles** - A dictionary mapping the unique file paths opened, to lists of `MockFH` objects. Each open creates a unique `MockFH` object. Each `MockFH` object itself has a number of useful attributes:

- **filename** - The path to the file which was opened using `salt.utils.files.fopen()`
- **call** - A `MockCall` object representing the arguments passed to `salt.utils.files.fopen()`. Note that this `MockCall` is also available in the parent `MockOpen` instance's `calls` list.
- The following methods are mocked using `unittest.mock.Mock` objects, and `Mock`'s built-in asserts (as well as the call data) can be used as you would with any other `Mock` object:

- \* `.read()`
- \* `.readlines()`
- \* `.readline()`
- \* `.close()`
- \* `.write()`
- \* `.writelines()`
- \* `.seek()`

- The read functions (`.read()`, `.readlines()`, `.readline()`) all work as expected, as does iterating through the file line by line (i.e. `for line in fh:`).
- The `.tell()` method is also implemented in such a way that it updates after each time the mocked filehandle is read, and will report the correct position. The one caveat here is that `.seek()` doesn't actually work (it's simply mocked), and will not change the position. Additionally, neither `.write()` or `.writelines()` will modify the mocked filehandle's contents.
- The attributes `.write_calls` and `.writelines_calls` (no parenthesis) are available as shorthands and correspond to lists containing the contents passed for all calls to `.write()` and `.writelines()`, respectively.

## Examples

```

with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
 # Run the code you are unit testing
 mymod.myfunc()
 # Check that only the expected file was opened, and that it was opened
 # only once.
 assert m_open.call_count == 1
 assert list(m_open.filehandles) == ['/etc/foo.conf']
 # "opens" will be a list of all the mocked filehandles opened
 opens = m_open.filehandles['/etc/foo.conf']
 # Check that we wrote the expected lines ("expected" here is assumed to
 # be a list of strings)
 assert opens[0].write_calls == expected

```

```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
 # Run the code you are unit testing
 mymod.myfunc()
 # Check that .readlines() was called (remember, it's a Mock)
 m_open.filehandles['/etc/foo.conf'][0].readlines.assert_called()
```

```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
 # Run the code you are unit testing
 mymod.myfunc()
 # Check that we read the file and also wrote to it
 m_open.filehandles['/etc/foo.conf'][0].read.assert_called_once()
 m_open.filehandles['/etc/foo.conf'][1].writelines.assert_called_once()
```

## Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the raise or return being tested.

Unit tests for `salt/.../<module>.py` are contained in a file called `tests/unit/.../test_<module>.py`, e.g. the tests for `salt/modules/fib.py` are in `tests/unit/modules/test_fib.py`.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with `test_` and each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the `test_*.py` naming syntax. This test file naming convention is how the test runner recognizes that a test file contains unit tests.

## Imports

Most commonly, the following imports are necessary to create a unit test:

```
from tests.support.unit import TestCase, skipIf
```

If you need mock support to your tests, please also import:

```
from tests.support.mock import NO_MOCK, NO_MOCK_REASON, MagicMock, patch, call
```

### 27.21.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading [Python's documentation on unit testing](#).

### 27.21.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it's necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as "blocking the exits" for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.

To achieve this behavior, Salt makes heavy use of the `MagicMock` package.

To understand how one might integrate Mock into writing a unit test for Salt, let's imagine a scenario in which we're testing an execution module that's designed to operate on a database. Furthermore, let's imagine two separate methods, here presented in psuedo-code in an imaginary execution module called 'db.py'.

```
def create_user(username):
 qry = 'CREATE USER {0}'.format(username)
 execute_query(qry)

def execute_query(qry):
 # Connect to a database and actually do the query...
```

Here, let's imagine that we want to create a unit test for the `create_user` function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear – to write a unit test which tests the functionality of `create_user` while also replacing 'execute\_query' with a mocked function.

To begin, we set up the skeleton of our class much like we did before, but with additional imports for `MagicMock`:

```
Import Salt Testing libs
from tests.support.unit import TestCase

Import Salt execution module to test
from salt.modules import db

Import Mock libraries
from tests.support.mock import NO_MOCK, NO_MOCK_REASON, MagicMock, patch, call

Create test case class and inherit from Salt's customized TestCase
Skip this test case if we don't have access to mock!
@skipIf(NO_MOCK, NO_MOCK_REASON)
class DbTestCase(TestCase):
 def test_create_user(self):
 # First, we replace 'execute_query' with our own mock function
 with patch.object(db, 'execute_query', MagicMock()) as db_exq:

 # Now that the exits are blocked, we can run the function under test.
 db.create_user('testuser')

 # We could now query our mock object to see which calls were made
 # to it.
 ## print db_exq.mock_calls

 # Construct a call object that simulates the way we expected
 # execute_query to have been called.
 expected_call = call('CREATE USER testuser')

 # Compare the expected call with the list of actual calls. The
 # test will succeed or fail depending on the output of this
 # assertion.
 db_exq.assert_has_calls(expected_call)
```

### 27.21.6 Modifying `__salt__` In Place

At times, it becomes necessary to make modifications to a module's view of functions in its own `__salt__` dictionary. Luckily, this process is quite easy.

Below is an example that uses MagicMock's `patch` functionality to insert a function into `__salt__` that's actually a MagicMock instance.

```
def show_patch(self):
 with patch.dict(my_module.__salt__,
 {'function.to_replace': MagicMock()}):
 # From this scope, carry on with testing, with a modified __salt__!
```

### 27.21.7 A Simple Example

Let's assume that we're testing a very basic function in an imaginary Salt execution module. Given a module called `fib.py` that has a function called `calculate(num_of_results)`, which given a `num_of_results`, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called `tests/unit/modules/test_fib.py`. The convention is to place unit tests for Salt execution modules in `test/unit/modules/` and to name the tests module prefixed with `test_*.py`.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. Test cases are created as Python classes in the unit test module. To return to our example, here's how we might write the skeleton for testing `fib.py`:

```
Import Salt Testing libs
from tests.support.unit import TestCase

Import Salt execution module to test
import salt.modules.fib as fib

Create test case class and inherit from Salt's customized TestCase
class FibTestCase(TestCase):
 '''
 This class contains a set of functions that test salt.modules.fib.
 '''
 def test_fib(self):
 '''
 To create a unit test, we should prefix the name with `test_` so
 that it's recognized by the test runner.
 '''
 fib_five = (0, 1, 1, 2, 3)
 self.assertEqual(fib.calculate(5), fib_five)
```

At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```
tests/runtests.py -v -n unit.modules.test_fib
```

This will report the status of the test: success, failure, or error. The `-v` flag increases output verbosity.

```
tests/runtests.py -n unit.modules.test_fib -v
```

To review the results of a particular run, take a note of the log location given in the output for each test:

```
Logging tests on /var/folders/nl/d809xbq577l3qrbj3ymtpbq80000gn/T/salt-runtests.log
```

## 27.21.8 A More Complete Example

Consider the following function from `salt/modules/linux_sysctl.py`.

```
def get(name):
 """
 Return a single sysctl parameter for this minion

 CLI Example:

 .. code-block:: bash

 salt '*' sysctl.get net.ipv4.ip_forward
 """
 cmd = 'sysctl -n {0}'.format(name)
 out = __salt__['cmd.run'](cmd)
 return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']()`, both of which need to be appropriately mocked.

Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of `MagicMock`. For added isolation, we will also redefine the `__salt__` dictionary such that it only contains `'cmd.run'`.

```
Import Salt Libs
import salt.modules.linux_sysictl as linux_sysctl

Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import skipIf, TestCase
from tests.support.mock import (
 MagicMock,
 patch,
 NO_MOCK,
 NO_MOCK_REASON
)

@skipIf(NO_MOCK, NO_MOCK_REASON)
class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
 """
 TestCase for salt.modules.linux_sysctl module
 """

 def test_get(self):
 """
 Tests the return of get function
 """
 mock_cmd = MagicMock(return_value=1)
 with patch.dict(linux_sysctl.__salt__, {'cmd.run': mock_cmd}):
 self.assertEqual(linux_sysctl.get('net.ipv4.ip_forward'), 1)
```

Since `get()` has only one raise or return statement and that statement is a success condition, the test function is simply named `test_get()`. As described, the single function call parameter, `name` is mocked with `net.ipv4.ip_forward` and `__salt__['cmd.run']` is replaced by a `MagicMock` function object. We are only interested in the return value of `__salt__['cmd.run']`, which `MagicMock` allows us by specifying via `return_value=1`. Finally, the test itself tests for equality between the return value of `get()` and the expected return of 1. This assertion is expected to succeed because `get()` will determine its return value from `__salt__['cmd.run']`, which we have mocked to return 1.

### 27.21.9 A Complex Example

Now consider the `assign()` function from the same `salt/modules/linux_sysctl.py` source file.

```
def assign(name, value):
 """
 Assign a single sysctl parameter for this minion

 CLI Example:

 .. code-block:: bash

 salt '*' sysctl.assign net.ipv4.ip_forward 1
 """
 value = str(value)
 sysctl_file = '/proc/sys/{0}'.format(name.replace('.', '/'))
 if not os.path.exists(sysctl_file):
 raise CommandExecutionError('sysctl {0} does not exist'.format(name))

 ret = {}
 cmd = 'sysctl -w {0}="{1}"'.format(name, value)
 data = __salt__['cmd.run_all'](cmd)
 out = data['stdout']
 err = data['stderr']

 # Example:
 # # sysctl -w net.ipv4.tcp_rmem="4096 87380 16777216"
 # net.ipv4.tcp_rmem = 4096 87380 16777216
 regex = re.compile(r'^{0}\s+=\s+{1}$'.format(re.escape(name),
 re.escape(value)))

 if not regex.match(out) or 'Invalid argument' in str(err):
 if data['retcode'] != 0 and err:
 error = err
 else:
 error = out
 raise CommandExecutionError('sysctl -w failed: {0}'.format(error))
 new_name, new_value = out.split(' = ', 1)
 ret[new_name] = new_value
 return ret
```

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-builtin functions. In the tests below you will see that `MagicMock`'s `patch()` method may be used as a context manager or as a decorator. When patching the salt dundered however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.

```

Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError

Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import skipIf, TestCase
from tests.support.mock import (
 MagicMock,
 patch,
 NO_MOCK,
 NO_MOCK_REASON
)

@skipIf(NO_MOCK, NO_MOCK_REASON)
class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
 """
 TestCase for salt.modules.linux_sysctl module
 """

 @patch('os.path.exists', MagicMock(return_value=False))
 def test_assign_proc_sys_failed(self):
 """
 Tests if /proc/sys/<kernel-subsystem> exists or not
 """
 cmd = {'pid': 1337, 'retcode': 0, 'stderr': '',
 'stdout': 'net.ipv4.ip_forward = 1'}
 mock_cmd = MagicMock(return_value=cmd)
 with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
 self.assertRaises(CommandExecutionError,
 linux_sysctl.assign,
 'net.ipv4.ip_forward', 1)

 @patch('os.path.exists', MagicMock(return_value=True))
 def test_assign_cmd_failed(self):
 """
 Tests if the assignment was successful or not
 """
 cmd = {'pid': 1337, 'retcode': 0, 'stderr':
 'sysctl: setting key "net.ipv4.ip_forward": Invalid argument',
 'stdout': 'net.ipv4.ip_forward = backward'}
 mock_cmd = MagicMock(return_value=cmd)
 with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
 self.assertRaises(CommandExecutionError,
 linux_sysctl.assign,
 'net.ipv4.ip_forward', 'backward')

 @patch('os.path.exists', MagicMock(return_value=True))
 def test_assign_success(self):
 """
 Tests the return of successful assign function
 """
 cmd = {'pid': 1337, 'retcode': 0, 'stderr': '',
 'stdout': 'net.ipv4.ip_forward = 1'}
 ret = {'net.ipv4.ip_forward': '1'}
 mock_cmd = MagicMock(return_value=cmd)

```

(continues on next page)

(continued from previous page)

```
with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
 self.assertEqual(linux_sysctl.assign(
 'net.ipv4.ip_forward', 1), ret)
```

## 27.22 raet

# RAET # Reliable Asynchronous Event Transport Protocol

See also:

[RAET Overview](#)

### 27.22.1 Protocol

Layering:

OSI Layers

7: Application: Format: Data (Stack to Application interface buffering etc) 6: Presentation: Format: Data (Encrypt-Decrypt convert to machine independent format) 5: Session: Format: Data (Interhost communications. Authentication. Groups) 4: Transport: Format: Segments (Reliable delivery of Message, Transactions, Segmentation, Error checking) 3: Network: Format: Packets/Datagrams (Addressing Routing) 2: Link: Format: Frames ( Reliable per frame communications connection, Media access controller ) 1: Physical: Bits (Transceiver communication connection not reliable)

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking, Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

### 27.22.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for "packed" binary body

### 27.22.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n  
10 13 10 13 ADAD 1010 1101 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header

Finally is an optional tail block for error checking or encryption details

#### 27.22.4 Header Fields

In UDP header

sh = source host sp = source port dh = destination host dp = destination port

In RAET Header

hk = header kind hl = header length

vn = version number

sd = Source Device ID dd = Destination Device ID cf = Corresponder Flag mf = Multicast Flag

si = Session ID ti = Transaction ID

sk = Service Kind pk = Packet Kind bf = Burst Flag (Send all Segments or Ordered packets without interleaved acks)

oi = Order Index dt = DateTime Stamp

sn = Segment Number sc = Segment Count

pf = Pending Segment Flag af = All Flag (Resent all Segments not just one)

nk = Auth header kind nl = Auth header length

bk = body kind bl = body length

tk = tail kind tl = tail length

fg = flags packed (Flags) Default '00' hex string 2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD flags

#### 27.22.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

#### 27.22.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID sid

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

#### 27.22.7 Service Types or Modular Services

Four Service Types

- A) One or more maybe (unacknowledged repeat) maybe means no guarantee

- B) **Exactly one at most (ack with retries) (duplicate detection idempotent)** at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay
- C) **Exactly one of sequence at most (sequence numbered)** Receiver requests retry of missing packet with same B1 or B2 retry type
- D) **End to End (Application layer Request Response)** This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1) **Maybe one or more**

- A) **Fire and forget** no transaction either side
- B) **Repeat, no ack, no dupdet** repeat counter send side, no transaction on receive side
- C) **Repeat, no Ack, dupdet** repeat counter send side, dup detection transaction receive side

2) **More or Less Once**

- A) **retry finite, ack no dupdet** retry timer send side, finite number of retries ack receive side no dupdet

3) **At most Once**

- A) **retry finite, ack, dupdet** retry timer send side, finite number of retries ack receive side dupdet

4) **Exactly once**

- A) **ack retry** retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff

5) **Sequential sequence number**

- A) reorder escrow
- B) Segmented packets

6) request response to application layer

Service Features

- 1) repeats
- 2) ack retry transaction id
- 3) sequence number duplicate detection out of order detection sequencing
- 4) rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End

A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive

B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected

B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retries so no duplicates.

C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.

D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response.

Little advantage to B1 vs B2 not having duplicates.

So 4 service types

- A) Maybe one or more (unacknowledged repeat)
- B) Exactly One (At most one) (ack with retry) (duplicate detection idempotent)
- C) One of Sequence (sequence numbered)
- D) End to End

Also multicast or unicast

Modular Transaction Table

**Sender Side:** Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence) Segmentation

**Receiver Side:** Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend Unsegmentation (request resends of missing segment)

## 27.23 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

### 27.23.1 New Code Entry

All new SaltStack code should be submitted against either the `develop` branch or a point release branch, depending on the nature of the submission. Please see the *Which Salt Branch?* section of Salt's *Contributing* documentation or the Release Branching section below for more information.

### 27.23.2 Release Branching

SaltStack maintains two types of releases, `Feature Releases` and `Point Releases` (also commonly referred to as `Bugfix Releases`). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

### Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
git checkout -b 2015.8 # From the develop branch
git push origin 2015.8
```

### Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the *Which Salt Branch?* section of Salt's *Contributing* documentation.

Generally point releases are made every 2 months or if there is a security fix they can be made sooner.

The point release is designated by branching (ex 2019.2.1) and then tagging (v2019.2.1) from that newly created release branch when its determined the release is stable. From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

## 27.24 Salt Conventions

### 27.24.1 Writing Salt Documentation

Salt's documentation is built using the [Sphinx](#) documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the <https://github.com/saltstack/salt/blob/develop/doc> subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

#### Style

The Salt project recommends the [IEEE style guide](#) as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The [NCBI style guide](#) is another very approachable resource.

#### Point-of-view

Use third-person perspective and avoid "I", "we", "you" forms of address. Identify the addressee specifically e.g., "users should", "the compiler does", etc.

## Active voice

Use active voice and present-tense. Avoid filler words.

## Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

```
This is a main heading
```

```
=====
```

Paragraph.

```
This is an exciting sub-heading!
```

```

```

Paragraph.

## Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually "and", "or", or "nor") in a series of three or more terms. For example, a list of three countries might be punctuated either as "France, Italy, and Spain" (with the serial comma), or as "France, Italy and Spain" (without the serial comma)."

When writing a list that includes three or more items, the serial comma should always be used.

## Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

## Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```
def my_function(value):
 """
 Upper-case the given value

 Usage:

 .. code-block:: python

 val = 'a string'
 new_val = myfunction(val)
 print(new_val) # 'A STRING'
```

(continues on next page)

(continued from previous page)

```
:param value: a string
:return: a copy of ``value`` that has been upper-cased
'''
return value.upper()
```

### Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```
def my_function(value):
 '''
 Upper-case the given value

 .. versionadded:: 2014.7.0

 <...snip...>
 '''
 return value.upper()
```

For changes to a function:

```
def my_function(value, strip=False):
 '''
 Upper-case the given value

 .. versionchanged:: 2016.3.0
 Added a flag to also strip whitespace from the string.

 <...snip...>
 '''
 if strip:
 return value.upper().strip()
 return value.upper()
```

### Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: *execution modules*, *state modules*, *renderer modules*. New modules must be added to the index manually.

1. Edit the file for the module type: *execution modules*, *state modules*, *renderer modules*, etc.
2. Add the new module to the alphabetized list.
3. *Build the documentation* which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

### Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

## Glossary entries

Link to *glossary entries* using the `term` role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a
custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```

## Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index directive` above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
 see: Reactor; Event
```

Another method is to use the `index role` inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`

```

Paragraph.

## Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:
```

```
My page
=====
```

Paragraph.

Unique labels can be linked using the `ref` role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should *not* be used to link documents together.

## Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the
:py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the :py:func:`file.managed <salt.states.file.managed>` function.
```

### Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master`, and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a single minion.
```

### Documentation Changes and Fixes

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt's main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt's [Contributing](#) page. You can read more about how to choose where to submit documentation fixes by reading the [Salt's Branch Topology](#) section.

For an explanation of how to submit changes against various branches, see the [Sending a GitHub pull request](#) section. Specifically, see the section describing how to `Create a new branch` and the steps that follow.

### Building the documentation

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.
2. Build the documentation using the provided Makefile or `.bat` file on Windows.

```
cd /path/to/salt/doc
make html
```

3. The generated documentation will be written to the `doc/_build/<format>` directory.
4. A useful method of viewing the HTML documentation locally is to start Python's built-in HTTP server:

Python 3:

```
cd /path/to/salt/doc/_build/html
python3 -m http.server
```

Python 2:

```
cd /path/to/salt/doc/_build/html
python -m SimpleHTTPServer
```

Then pull up the documentation in a web browser at <http://localhost:8000/>.

## 27.24.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub:

<https://github.com/saltstack-formulas>

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```
base:
 'web*':
 - apache
```

### Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

#### Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install any necessary dependencies and configure GitFS.*
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
gitfs_remotes:
 - https://github.com/saltstack-formulas/apache-formula
 - https://github.com/saltstack-formulas/memcached-formula
```

**We strongly recommend forking a formula repository** into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileservers environments (i.e. saltenvs). Using the `all_saltenvs` parameter, files from a single git branch/tag will appear in all environments. See [here](#) for more information on this feature.

#### Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

or

mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
file_roots:
 base:
 - /srv/salt
 - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

## Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

## Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
 - epel

python26:
 pkg.installed:
 - require:
 - pkg: epel
```

## Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```
base:
 'myopenstackmaster':
 - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
 'controller':
 - openstack.horizon
 - openstack.keystone
 'hyper-*':
 - openstack.nova
 - openstack.glance
 'storage-*':
 - openstack.swift
```

## Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

## Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using *extend*, they can be made to watch other states with *The \_in versions of requisites*.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
Include the stock, upstream apache formula.
include:
 - apache

Use the watch_in requisite to cause the apache service state to reload
apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
 file:
 - managed
 - name: /etc/apache2/sites-available/my-example-com
 - watch_in:
 - service: apache
```

Don't be shy to read through the source for each Formula!

## Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

## Writing Formulas

Each Formula is a separate repository in the `saltstack-formulas` organization on GitHub.

## Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the [saltstack-formulas](#) organization and help you transfer the repository over. Ping a SaltStack employee on IRC ([#salt](#) on Freenode), join the [#formulas](#) channel on the [salt-slack](#) or send an email to the [salt-users](#) mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: <https://github.com/watching>.

Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to [at-mention](#) other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to "selfie-merge" your own pull request.

## Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
Deploy the stable master branch unless version overridden by passing
Pillar at the CLI or via the Reactor.

deploy_myapp:
 git.latest:
 - name: git@github.com/myco/myapp.git
 - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

## Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in [requisites](#). It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

## Use `module.function` notation

So-called "short-declaration" notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
Do
apache:
 pkg.installed:
 - name: httpd

Don't
apache:
```

(continues on next page)

(continued from previous page)

```

pkg:
- installed
- name: httpd

```

Salt's state compiler will transform "short-decs" into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

### Specify the name parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

### Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```

Start with a high-level description of the current sls file.
Explain the scope of what it will do or manage.

Comment individual states as necessary.
update_a_config_file:
 # Provide details on why an unusual choice was made. For example:
 #
 # This template is fetched from a third-party and does not fit our
 # company norm of using Jinja. This must be processed using Mako.
 file.managed:
 - name: /path/to/file.cfg
 - source: salt://path/to/file.cfg.template
 - template: mako

 # Provide a description or explanation that did not fit within the state
 # ID. For example:
 #
 # Update the application's last-deployed timestamp.
 # This is a workaround until Bob configures Jenkins to automate RPM
 # builds of the app.
 cmd.run:
 # FIXME: Joe needs this to run on Windows by next quarter. Switch these
 # from shell commands to Salt's file.managed and file.replace state
 # modules.
 - name: |
 touch /path/to/file_last_updated
 sed -e 's/foo/bar/g' /path/to/file_environment
 - onchanges:
 - file: a_config_file

```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```
BAD EXAMPLE
The Jinja in this YAML comment is still executed!
{% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

GOOD EXAMPLE
The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}
```

## Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

## Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *renderer* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt's state system finally starts and executes on each "chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the "running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

## Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

## Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

## Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}
{# or #}
{% import_yaml 'path/to/file.yaml' as some_data %}
{# or #}
{% import_json 'path/to/file.json' as some_data %}
{# or #}
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}
{# or #}
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

## Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt.pillar.get('list_of_users', []) %}
{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
 user.present:
 - name: {{ user.name }}
```

(continues on next page)

(continued from previous page)

```

- shell: {{ user.shell }}

{% endfor %}

```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```

{# ---- Bad example ---- #}

apache:
 pkg.installed:
 {% if grains.os_family == 'RedHat' %}
 - name: httpd
 {% elif grains.os_family == 'Debian' %}
 - name: apache2
 {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

apache:
 pkg.installed:
 - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
 'RedHat': 'httpd',
 'Debian': 'apache2',
}.get(grains.os_family) %}

apache:
 pkg.installed:
 - name: {{ name }}

```

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```

{# ---- Bad example ---- #}

haproxy_conf:
 file.managed:
 - name: /etc/haproxy/haproxy.cfg
 - template: jinja
 {% if 'external_loadbalancer' in grains.roles %}
 - source: salt://haproxy/external_haproxy.cfg
 {% elif 'internal_loadbalancer' in grains.roles %}
 - source: salt://haproxy/internal_haproxy.cfg
 {% endif %}

```

(continues on next page)

(continued from previous page)

```

- context:
 {% if 'external_loadbalancer' in grains.roles %}
 ssl_termination: True
 {% elif 'internal_loadbalancer' in grains.roles %}
 ssl_termination: False
 {% endif %}

{# ---- Better example ---- #}

{% load_yaml as haproxy_defaults %}
common_settings:
 bind_port: 80

internal_loadbalancer:
 source: salt://haproxy/internal_haproxy.cfg
 settings:
 bind_port: 8080
 ssl_termination: False

external_loadbalancer:
 source: salt://haproxy/external_haproxy.cfg
 settings:
 ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
 file.managed:
 - name: /etc/haproxy/haproxy.cfg
 - template: jinja
 - source: {{ haproxy.source }}
 - context: {{ haproxy.settings | yaml() }}

```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

### Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated – long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets – instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain – switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's "she-bang" syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```
base:
 '*':
 - common_configuration
 - roles_configuration
```

/srv/salt/common\_configuration.sls:

```
common_users:
 user.present:
 - names:
 - larry
 - curly
 - moe
```

/srv/salt/roles\_configuration:

```
#!/py
def run():
 list_of_roles = set()

 # This example has the minion id in the form 'web-03-dev'.
 # Easily access the grains dictionary:
 try:
 app, instance_number, environment = __grains__['id'].split('-')
 instance_number = int(instance_number)
 except ValueError:
 app, instance_number, environment = ['Unknown', 0, 'dev']

 list_of_roles.add(app)

 if app == 'web' and environment == 'dev':
 list_of_roles.add('primary')
 list_of_roles.add('secondary')
 elif app == 'web' and environment == 'staging':
 if instance_number == 0:
 list_of_roles.add('primary')
 else:
 list_of_roles.add('secondary')

 # Easily cross-call Salt execution modules:
 if __salt__['myutils.query_valid_ec2_instance']():
 list_of_roles.add('is_ec2_instance')

 return {
 'set_roles_grains': {
 'grains.present': [
 {'name': 'roles'},
 {'value': list(list_of_roles)},
],
 },
 }
```

## Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
 user.present:
 - name: {{ user_name }}
 - shell: {{ shell }}
 - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

/srv/salt/php.sls:

```
php_ini:
 file.managed:
 - name: /etc/php.ini
 - source: salt://php.ini.tpl
 - template: jinja
 - context:
 php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

/srv/pillar/php.sls:

```
php_ini:
 PHP:
 engine: 'On'
 short_open_tag: 'Off'
 error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

/srv/salt/php.ini.tpl:

```
{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

## Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increase the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
 'Debian': {
 'server': 'mysql-server',
 'client': 'mysql-client',
 'service': 'mysql',
 'config': '/etc/mysql/my.cnf',
 'python': 'python-mysqldb',
 },
 'RedHat': {
 'server': 'mysql-server',
 'client': 'mysql',
 'service': 'mysqld',
 'config': '/etc/my.cnf',
 'python': 'MySQL-python',
 },
 'Gentoo': {
 'server': 'dev-db/mysql',
 'client': 'dev-db/mysql',
 'service': 'mysql',
 'config': '/etc/mysql/my.cnf',
 'python': 'dev-python/mysql-python',
 },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
 pkg.installed:
 - name: {{ mysql.server }}
 service.running:
 - name: {{ mysql.service }}
```

## Organizing Pillar data

It is considered a best practice to make formulas expect **all** formula-related parameters to be placed under second-level `lookup` key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
 lookup:
 version: 5.7.11
```

## Collecting common values

Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

map.jinja:

```
{% set mysql = salt['grains.filter_by']({
 'default': {
 'server': 'mysql-server',
 'client': 'mysql-client',
 'service': 'mysql',
 'config': '/etc/mysql/my.cnf',
 'python': 'python-mysqldb',
 },
 'Debian': {
 },
 'RedHat': {
 'client': 'mysql',
 'service': 'mysqld',
 'config': '/etc/my.cnf',
 'python': 'MySQL-python',
 },
 'Gentoo': {
 'server': 'dev-db/mysql',
 'client': 'dev-db/mysql',
 'python': 'dev-python/mysql-python',
 },
},
merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

## Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in *filter\_by* specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```
mysql:
 lookup:
 config: /usr/local/etc/mysql/my.cnf
```

**Note:** Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```
{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty."' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```
foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""
```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

## When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

## Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

## Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml:`

```

Server:
 '@port': '8005'
 '@shutdown': SHUTDOWN
GlobalNamingResources:
 Resource:
 '@auth': Container
 '@description': User database that can be updated and saved
 '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
 '@name': UserDatabase
 '@pathname': conf/tomcat-users.xml
 '@type': org.apache.catalina.UserDatabase
 # <...snip...>

```

`/srv/pillar/tomcat.sls:`

```

appX:
 server_xml_overrides:
 Server:
 Service:
 '@name': Catalina
 Connector:
 '@port': '8009'
 '@protocol': AJP/1.3
 '@redirectPort': '8443'
 # <...snip...>

```

`/srv/salt/tomcat/server_xml.sls:`

```

{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
 'appX:server_xml_overrides',
 default=server_xml_defaults,
 merge=True)
%}

appX_server_xml:
 file.serialize:
 - name: /etc/tomcat/server.xml
 - dataset: {{ server_xml_final_values | json() }}
 - formatter: xml_badgerfish

```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the 'Nginx vhosts' states or the `php.ini` file template.

## Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

/srv/salt/app/deploy.sls:

```
{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt.grains.get('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
table. #}
{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
 git.latest:
 - name: {{ app.repo_url }}
 - version: {{ app.version }}
 - target: {{ app.deploy_dir }}

myco/myapp/deployed:
 event.send:
 - data:
 version: {{ app.version }}
 - onchanges:
 - git: deploy_application
```

/srv/salt/app/defaults.yaml:

```
appX:
 repo_url: git@github.com:myco/appX.git
 target: /var/www/appX
 version: master
appY:
 repo_url: git@github.com:myco/appY.git
 target: /var/www/appY
 version: v1.2.3.4
```

## Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full [apache-formula](#) for more.)

```
apache/init.sls
apache:
 pkg.installed:
 [...]
 service.running:
 [...]

apache/mod_wsgi.sls
include:
 - apache

mod_wsgi:
 pkg.installed:
 [...]
 - require:
 - pkg: apache

apache/conf.sls
include:
 - apache

apache_conf:
 file.managed:
 [...]
 - watch_in:
 - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The `mod_wsgi` state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

## Parameterization

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere – it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
 {'name': 'larry', 'shell': 'bash'},
 {'name': 'curly', 'shell': 'bash'},
```

(continues on next page)

(continued from previous page)

```

 {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
 {{ user.name }}:
 user.present:
 - name: {{ user.name }}
 - shell: {{ user.shell }}
{% endfor %}

```

## Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

## Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```

{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
 file.managed:
 - name: {{ apache.conf_dir }}
 - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
 - template: {{ settings.get('template_engine', 'jinja') }}

```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

## Scripting

Remember that both State files and Pillar files can easily call out to Salt *execution modules* and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
 file:
 - symlink
 - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

## Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
| |-- map.jinja
| |-- init.sls
| `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

[template-formula](#)

The [template-formula](#) repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

## README.rst

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===

Install and configure the F00 service.

NOTE

See the full `Salt Formulas installation and usage instructions
<https://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`_.
```

(continues on next page)

(continued from previous page)

**Available states**

=====

```
.. contents::
 :local:
```

```
``foo``
```

-----

Install the ``foo`` package and enable the service.

```
``foo.bar``
```

-----

Install the ``bar`` package.

**CHANGELOG.rst**

The `CHANGELOG.rst` file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the `CHANGELOG.rst` file:

`CHANGELOG.rst`:

**foo formula**

=====

0.0.2 (2013-01-01)

- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified

**Versioning**

Formula are versioned according to Semantic Versioning, <http://semver.org/>.

---

**Note:** Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

---

Formula versions are tracked using Git tags as well as the `VERSION` file in the formula repository. The `VERSION` file should contain the currently released version of the particular formula.

## Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

### 27.24.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

#### Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the `master.d` or `minion.d` directories.

#### Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

#### Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

#### Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

#### Salt Common

The `salt-common` or `salt` package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.

## Name

- *salt* OR *salt-common*

## Files

- *salt/\**
- *man/salt.7*
- *scripts/salt-call*
- *tests/\**
- *man/salt-call.1*

## Depends

- Python 2.6-2.7
- PyYAML
- Jinja2

## Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

## Name

- *salt-master*

## Files

- *scripts/salt-master*
- *scripts/salt*
- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*
- *pkg/<master init data>*
- *man/salt.1*
- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

## Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

## Name

- *salt-syndic*

## Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

## Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

### Name

- *salt-minion*

### Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

### Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

### Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

### Name

- *salt-ssh*

### Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud\**

### Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

### Name

- *salt-cloud*

### Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

### Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

## Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

### Name

- *salt-doc*

### Files

- *doc/\**

### Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

## 27.24.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

### Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 2019.2.0 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Notify salt-users and salt-announce google groups when the feature freeze branch creation will occur so they can try to get their work merged.
4. Create QA test plan. Review features planned for the release and determine if there is sufficient test coverage.
5. Ensure all required features are merged.
6. Complete one last merge forward from the previous branch.
7. Create feature release branch with the name of the release. (ex. fluorine)
8. Create issue to start the process of deprecating for the next feature release.
9. Create jenkins jobs to test the new feature release branch.
10. Inform salt-users and salt-announce google groups feature branch and freeze is complete.
11. Add new feature branch to salt-jenkins repo and the kitchen yml file.
12. Fix tests failing in jenkins test runs.
13. Finalize QA test plan and add all required tests.
14. Run through a manual test run based off of the head of the feature branch.
15. Convert the feature release branch to the version number. For example (v2019.2) This is based off of the year and month that is planned to release.
16. Migrate both the jenkins test jobs and salt-jenkins repo to the new branch number.
17. Notify salt-users and salt-announce google groups of the new version branch number and migrate any PRs to the new branch.
18. Delete old feature release branch name (ex. fluorine)
19. Update all name references to version number in the docs. For example all fluorine references in the docs needs to be moved to v2019.2.0
20. Create RC release branch. (ex. 2019.2.0.rc)
21. Create new jenkins test jobs with new RC release branch
22. Notify salt-users and salt-announce google groups of the new RC branch.
23. Fix tests failing in jenkins test runs.
24. Review the release notes with major features.
25. Generate the new man pages for the release.
26. Create internal RC tag for testing.
27. Build latest windows, mac, ubuntu, debian and redhat packages.
28. Run manual and package tests against new RC packages.
29. Update release candidate docs with the new version. (ex. 2019.2.0rc1)
30. Push the internal tag live to salt's repo.

31. Publish release archive to pypi based off tag.
32. Push the RC packages live.
33. Announce new RC to salt-users and salt-announce google groups.
34. Triage incoming issues based on the new RC release.
35. Fix RC issues once they are categorized as a release blocker.
36. Depending on the issues found during the RC process make a decision on whether to release based off the RC or go through another RC process, repeating the steps starting at ensuring the tests are not failing.
37. If a RC is categorized as stable, build all required packages.
38. Test all release packages.
39. Test links from [repo.saltstack.com](http://repo.saltstack.com).
40. Update installation instructions with new release number at [repo.saltstack.com](http://repo.saltstack.com).
41. Update and build docs to include new version (2019.2) as the latest.
42. Pre-announce on salt-users google group that we are about to update our repo.
43. Publish release (v2019.2.0) archive to pypi based off tag.
44. Publish all packages live to repo.
45. Publish the docs.
46. Create release at [github](https://github.com)
47. Update win-repo-ng with new salt versions.
48. Announce release is live to irc, salt-users, salt-announce and release slack community channel.

### Maintenance and Bugfix Releases

Once a feature release branch has been cut from `develop`, the branch moves into a "feature freeze" state. The new release branch enters the `merge-forward` chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. Ensure all required bug fixes are merged.
2. Inform salt-users and salt-announce we are going to branch for the release.
3. Complete one last merge forward from the previous branch.
4. Create release branch with the version of the release. (ex. 2019.2.1)
5. Create jenkins jobs that test the new release branch.
6. Fix tests failing in jenkins test runs.
7. Run through a manual test run based off of the head of the branch.
8. Generate the new man pages for the release.
9. Create internal tag for testing.(ex v2019.2.1)
10. Build all release packages.
11. Run manual and package tests against new packages.
12. Update installation instructions with new release number at [repo.saltstack.com](http://repo.saltstack.com).
13. Update and build docs to include new version. (ex. 2019.2.1)

14. Pre-announce on salt-users google groups that we are about to update our repo.
15. Push the internal tag live to salt's repo.
16. Publish release archive to pypi based off tag.
17. Push the packages live.
18. Publish release (v2019.2.1) archive to pypi based off tag.
19. Publish all packages live to repo.
20. Publish the docs.
21. Create release at [github](#)
22. Update win-repo-ng with new salt versions.
23. Announce release is live to irc, salt-users, salt-announce and release slack channel.

For more information about the difference between the `develop` branch and bugfix release branches, please refer to the [Which Salt Branch?](#) section of Salt's [Contributing](#) documentation.

### 27.24.5 Salt Coding Style

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be "Salty".

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

#### Linting

Most Salt style conventions are codified in Salt's `.testing.pylintrc` file. Salt's pylint file has two dependencies: `pylint` and `saltpylint`. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.testing.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the `pylint` program as follows:

```
pylint --rcfile=/path/to/salt/.testing.pylintrc salt/dir/to/lint
```

---

**Note:** There are two pylint files in the `salt` directory. One is the `.pylintrc` file and the other is the `.testing.pylintrc` file. The tests that run in Jenkins against GitHub Pull Requests use `.testing.pylintrc`. The `testing.pylintrc` file is a little less strict than the `.pylintrc` and is used to make it easier for contributors to submit changes. The `.pylintrc` file can be used for linting, but the `testing.pylintrc` is the source of truth when submitting pull requests.

---

## Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

## Strings

Salt follows a few rules when formatting strings:

### Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```
def foo():
 """
 A function that does things
 """
 name = 'A name'
 return name
```

### Formatting Strings

All strings which require formatting should use the `.format` string method:

```
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6.

Please do NOT use printf formatting.

### Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```
def bar():
 """
 Here lies a docstring with a newline after the quotes and is the salty
 way to handle it! Vertical code is the way to go!
 """
 return
```

BAD:

```
def baz():
 '''This is not ok!'''
 return
```

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```
def new_func(msg=''):
 '''
 .. versionadded:: 0.16.0

 Prints what was passed to the function.

 msg : None
 The string to be printed.
 '''
 print msg
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your *pull request* and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg='', signature=''):
 '''
 .. versionadded:: 0.16.0

 Prints what was passed to the function.

 msg : None
 The string to be printed. Will be prepended with 'Greetings! '

 .. versionchanged:: 0.17.1

 signature : None
 An optional signature.

 .. versionadded 0.17.0
 '''
 print 'Greetings! {0}\n\n{1}'.format(msg, signature)
```

## Dictionaries

Dictionaries should be initialized using `{}` instead of `dict()`.

See [here](#) for an in-depth discussion of this topic.

## Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will

include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```
import os

def minion_path():
 path = os.path.join(self.opts['cachedir'], 'minions')
 return path
```

This on the other hand is *DISCOURAGED*:

```
from os.path import join

def minion_path():
 path = join(self.opts['cachedir'], 'minions')
 return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```
from salt.exceptions import CommandExecutionError
```

## Absolute Imports

Although `absolute imports` seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

**Note:** An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

## Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```
import os

os.chmod(
 os.path.join(self.opts['sock_dir'],
 'minion_event_pub.ipc'),
 448
)
```

Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```
def managed(name,
 source=None,
 source_hash='',
 user=None,
 group=None,
 mode=None,
 template=None,
 makedirs=False,
 context=None,
 replace=True,
 defaults=None,
 saltenv=None,
 backup='',
 **kwargs):
```

---

**Note:** Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

---

### Line Length

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line.

Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don't break it. Still, try to avoid passing that 120 characters limit and remember, **vertical is better... unless it isn't**

### Indenting

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn't differentiate from a new indent level.

Right:

```
def managed(name,
 source=None,
 source_hash='',
 user=None)
```

WRONG:

```
def managed(name,
 source=None,
 source_hash='',
 user=None)
```

Lining up the indent is also correct:

```
def managed(name,
 source=None,
 source_hash='',
 user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a **known conflict** between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in `~/.config/flake8`:

```
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper – just replace all instances of 'flake8' with 'pep8', including the filename.

## Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (<http://legacy.python.org/dev/peps/pep-0008/>) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

## 27.25 Salt code and internals

Reference documentation on Salt's internal code.

### 27.25.1 Contents

#### `salt.aggregation`

#### `salt.utils.aggregation`

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

---

**Note:** The following examples will be expressed in YAML for convenience's sake:

- `!aggr-scalar` will refer to Scalar python function
  - `!aggr-map` will refer to Map python object
  - `!aggr-seq` will refer for Sequence python object
- 

### How to instructs merging

This yaml document has duplicate keys:

```
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

### Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

### Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

## Introspection

TODO: write this part

```

salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=<class
 'salt.utils.aggregation.Map'>, sequence_class=<class
 'salt.utils.aggregation.Sequence'>)

```

Merge obj\_b into obj\_a.

```

>>> aggregate('first', 'second', True) == ['first', 'second']
True

```

**class** salt.utils.aggregation.**Aggregate**

Aggregation base.

**class** salt.utils.aggregation.**Map**

Map aggregation.

salt.utils.aggregation.**Scalar**(obj)

Shortcut for Sequence creation

```

>>> Scalar('foo') == Sequence(['foo'])
True

```

**class** salt.utils.aggregation.**Sequence**

Sequence aggregation.

## Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

---

*salt.exceptions*

This module is a central location for all salt exceptions

---

### salt.exceptions

This module is a central location for all salt exceptions

**exception** salt.exceptions.**ArgumentValueError**(message="", info=None)

Used when an invalid argument was passed to a command execution

**exception** salt.exceptions.**AuthenticationError**(message="")

If sha256 signature fails during decryption

**exception** salt.exceptions.**AuthorizationError**(message="")

Thrown when runner or wheel execution fails due to permissions

**exception** salt.exceptions.**CheckError**(message="", info=None)

Used when a check fails

**exception** salt.exceptions.**CommandExecutionError**(message="", info=None)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

**exception** salt.exceptions.**CommandNotFoundError**(message="")

Used in modules or grains when a required binary is not available

**exception** `salt.exceptions.EauthAuthenticationError` (*message=""*)

Thrown when eauth authentication fails

**exception** `salt.exceptions.FileLockError` (*message, time\_start=None, \*args, \*\*kwargs*)

Used when an error occurs obtaining a file lock

**exception** `salt.exceptions.FileserverConfigError` (*message=""*)

Used when invalid fileserver settings are detected

**exception** `salt.exceptions.GitLockError` (*errno, message, \*args, \*\*kwargs*)

Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in `salt.utils.gitfs`.

NOTE: While this uses the `errno` param similar to an `OSError`, this exception class is *not* as subclass of `OSError`. This is done intentionally, so that this exception class can be caught in a `try/except` without being caught as an `OSError`.

**exception** `salt.exceptions.GitRemoteError` (*message=""*)

Used by `GitFS` to denote a problem with the existence of the "origin" remote or part of its configuration

**exception** `salt.exceptions.InvalidConfigError` (*message="", info=None*)

Used when the config is invalid

**exception** `salt.exceptions.InvalidEntityError` (*message="", info=None*)

Used when an entity fails validation

**exception** `salt.exceptions.LoaderError` (*message=""*)

Problems loading the right renderer

**exception** `salt.exceptions.MasterExit`

Rise when the master exits

**exception** `salt.exceptions.MinionError` (*message=""*)

Minion problems reading uris such as `salt://` or `http://`

**exception** `salt.exceptions.MissingSmb` (*message=""*)

Raised when no smb library is found.

**exception** `salt.exceptions.NotImplemented` (*message=""*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

**exception** `salt.exceptions.PkgParseError` (*message=""*)

Used when of the `pkg` modules cannot correctly parse the output from the CLI tool (`pacman`, `yum`, `apt`, `aptitude`, etc)

**exception** `salt.exceptions.PublishError` (*message=""*)

Problems encountered when trying to publish a command

**exception** `salt.exceptions.SaltCacheError` (*message=""*)

Thrown when a problem was encountered trying to read or write from the salt cache

**exception** `salt.exceptions.SaltClientError` (*message=""*)

Problem reading the master root key

**exception** `salt.exceptions.SaltClientTimeout` (*message, jid=None, \*args, \*\*kwargs*)

Thrown when a job sent through one of the Client interfaces times out

Takes the `jid` as a parameter

**exception** `salt.exceptions.SaltCloudConfigError` (*message=""*)

Raised when a configuration setting is not found and should exist.

**exception** `salt.exceptions.SaltCloudException` (*message=""*)

Generic Salt Cloud Exception

- exception** `salt.exceptions.SaltCloudExecutionFailure` (*message=""*)  
Raised when too much failures have occurred while querying/waiting for data.
- exception** `salt.exceptions.SaltCloudExecutionTimeout` (*message=""*)  
Raised when too much time has passed while querying/waiting for data.
- exception** `salt.exceptions.SaltCloudNotFound` (*message=""*)  
Raised when some cloud provider function cannot find what's being searched.
- exception** `salt.exceptions.SaltCloudPasswordError` (*message=""*)  
Raise when virtual terminal password input failed
- exception** `salt.exceptions.SaltCloudSystemExit` (*message, exit\_code=1*)  
This exception is raised when the execution should be stopped.
- exception** `salt.exceptions.SaltConfigurationError` (*message=""*)  
Configuration error
- exception** `salt.exceptions.SaltDaemonNotRunning` (*message=""*)  
Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).
- exception** `salt.exceptions.SaltDeserializationError` (*message=""*)  
Thrown when salt cannot deserialize data.
- exception** `salt.exceptions.SaltException` (*message=""*)  
Base exception class; all Salt-specific exceptions should subclass this
- pack()**  
Pack this exception into a serializable dictionary that is safe for transport via msgpack
- exception** `salt.exceptions.SaltInvocationError` (*message=""*)  
Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line
- exception** `salt.exceptions.SaltMasterError` (*message=""*)  
Problem reading the master root key
- exception** `salt.exceptions.SaltMasterUnresolvableError` (*message=""*)  
Problem resolving the name of the Salt master
- exception** `salt.exceptions.SaltNoMinionsFound` (*message=""*)  
An attempt to retrieve a list of minions failed
- exception** `salt.exceptions.SaltRenderError` (*message, line\_num=None, buf="", marker='<=====', trace=None*)  
Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, `get_context` will be invoked to get the location of the error.
- exception** `salt.exceptions.SaltReqTimeoutError` (*message=""*)  
Thrown when a salt master request call fails to return within the timeout
- exception** `salt.exceptions.SaltRunnerError` (*message=""*)  
Problem in runner
- exception** `salt.exceptions.SaltSyndicMasterError` (*message=""*)  
Problem while proxying a request in the syndication master
- exception** `salt.exceptions.SaltSystemExit` (*code=0, msg=None*)  
This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.
- exception** `salt.exceptions.SaltWheelError` (*message=""*)  
Problem in wheel

**exception** `salt.exceptions.TemplateError` (*message=""*)

Used when a custom error is triggered in a template

**exception** `salt.exceptions.TimedProcTimeoutError` (*message=""*)

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

**exception** `salt.exceptions.TimeoutError` (*message=""*)

Thrown when an operation cannot be completed within a given time limit.

**exception** `salt.exceptions.TokenAuthenticationError` (*message=""*)

Thrown when token authentication fails

**exception** `salt.exceptions.VMwareApiError` (*message=""*, *info=None*)

Used when representing a generic VMware API error

**exception** `salt.exceptions.VMwareConnectionError` (*message=""*, *info=None*)

Used when the client fails to connect to either a VMware vCenter server or to a ESXi host

**exception** `salt.exceptions.VMwareFileNotFoundError` (*message=""*, *info=None*)

Used when representing a generic VMware error if a file not found

**exception** `salt.exceptions.VMwareMultipleObjectsError` (*message=""*, *info=None*)

Used when multiple objects were retrieved (and one was expected)

**exception** `salt.exceptions.VMwareNotFoundError` (*message=""*, *info=None*)

Used when a VMware object was not found

**exception** `salt.exceptions.VMwareObjectExistsError` (*message=""*, *info=None*)

Used when a VMware object already exists

**exception** `salt.exceptions.VMwareObjectNotFoundError` (*message=""*, *info=None*)

Used when a VMware object was not found

**exception** `salt.exceptions.VMwareObjectRetrievalError` (*message=""*, *info=None*)

Used when a VMware object cannot be retrieved

**exception** `salt.exceptions.VMwarePowerOnError` (*message=""*, *info=None*)

Used when error occurred during power on

**exception** `salt.exceptions.VMwareRuntimeError` (*message=""*, *info=None*)

Used when a runtime error is encountered when communicating with the vCenter

**exception** `salt.exceptions.VMwareSaltError` (*message=""*, *info=None*)

Used when a VMware object cannot be retrieved

**exception** `salt.exceptions.VMwareSystemError` (*message=""*, *info=None*)

Used when representing a generic VMware system error

**exception** `salt.exceptions.VMwareVmCreationError` (*message=""*, *info=None*)

Used when a configuration parameter is incorrect

**exception** `salt.exceptions.VMwareVmRegisterError` (*message=""*, *info=None*)

Used when a configuration parameter is incorrect

`salt.exceptions.get_error_message` (*error*)

Get human readable message from Python Exception

## The Salt Fileserver and Client

## Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a developer's reference, to help explain how the fileserver and clients both work.

## Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense. Instead, the fileserver is simply a class (`salt.fileserver.Fileserver`), located in `salt/fileserver/__init__.py`. This class has access to the configured fileserver backends via a loader instance, referenced as `self.servers`. When a request comes in from the fileclient, it will ultimately result in a `Fileserver` class function being run.

The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request...
2. which triggers the fileserver to run a function...
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the `find_file` function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won't proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the `salt.fileserver.Fileserver` class. For instance, there is a function called `update`, which exists to update remote fileservers such as the `git`, `hg`, and `svn` backends. This action has no use however in the `roots` backend, so it is simply not implemented there, and thus the `roots` backend will be skipped if the `update` function is run on the fileserver.

Backends for the fileserver are located in `salt/fileserver/` (the files not named `__init__.py`).

## Fileclient

There are three fileclient classes:

### `salt.fileclient.RemoteClient`

This client is used when `file_client` is set to `remote`. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the master to do other things, such as updating and requesting data from the master. The payload will be a dictionary with a key called `cmd`, and other values as needed.

Payloads sent via the transport channel are processed by an `MWorker` instance on the master, and the `MWorker`'s `_handle_aes()` function will execute the command. The command will be a function attribute of the `salt.master.AESFuncs` class. The `AESFuncs` class' `__setup_fileserver()` function instantiates a `salt.fileserver.Fileserver` instance and maps its member functions to `AESFuncs` attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transporting files is done in chunks, the size of which is decided by the `file_buffer_size` config option. If you look at the `serve_file()` function in any of the fileserver backends, you can see how the `loc` value in the payload determines the offset so that an intermediate chunk of the file can be served. The `RemoteClient`'s `get_file()` function will loop until the end of the file is reached, retrieving one chunk at a time.

### `salt.fileclient.FSClient`

This client is used when `file_client` is set to `local`. This is how masterless minions request files.

This class inherits from the `RemoteClient`, but instead of using a transport channel (zmq, tcp, etc.), it uses a "fake" transport channel (`salt.fileserver.FSChan`), which implements its own `send()` function. Thus, when a function that the `FSClient` inherits from the `RemoteClient` runs `self.channel.send()`, it's actually calling `salt.fileserver.FSChan.send()`, which calls corresponding functions in the `salt.fileserver.Fileserver()` class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the `FSChan`'s `Fileserver` instance.

### `salt.fileclient.LocalClient`

This client is now used exclusively by Pillar. This used to be used when `file_client` was set to `local`, but the `FSChan` class was written to allow minions with `file_client: local` to access the full set of backends. This class will probably be renamed at some point as it is often confused with `salt.client.LocalClient`.

## The `cp` Module

Most of the user-facing interaction with the fileclient happens via the `cp` module. The functions in this module instantiate a fileclient instance (if one is not already saved to the `__context__` dunder) and run fileclient functions.

## Updating the Fileserver

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of `salt.master.Maintenance`, which loops forever, running a series of functions and then sleeping for a length of time determined by the `loop_interval` config option. One of the maintenance tasks is to update the fileserver, and it essentially runs `salt.fileserver.Fileserver.update()`, which as we know from above will run all configured backends' `update()` functions, if present. This is now remote file servers like `git`, `hg`, and `svn` stay up-to-date.

For the local `file_client` (`FSClient`), since it does not interact with the master, upon spawning of its `FSChan` it will update the fileserver.

## Salt `opts` dictionary

It is very common in the Salt codebase to see `opts` referred to in a number of contexts.

For example, it can be seen as `__opts__` in certain cases, or simply as `opts` as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of `opts` from scratch in order to have it available for a given function.

To do so, use the utility functions available in `salt.config`.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display *opts* for a master, the process is similar:

```
import salt.config
opts = salt.config.master_config('/etc/salt/master')
print(opts)
```

## Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's *excellent introduction to the topic* <<http://nedbatchelder.com/text/unipain/unipain.html>>.

Salt's basic workflow for Unicode handling is as follows:

- 1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.
- 2) Modules and various Salt pluggable systems use incoming data assuming Unicode.
  - 2.1) For Salt modules that query an API; the module should convert the data received from the API into Unicode.
  - 2.2) For Salt modules that shell out to get output; the module should convert data received into Unicode. (This does not apply if using the *cmd* execution module, which should handle this for you.
  - 2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.
- 3) When a function in a Salt module returns a string, it should return a unicode type in Python 2.
- 4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

## 27.26 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

### 27.26.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

<http://hubblestack.io/>

### 27.26.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

<https://github.com/zulily/alkali>

### 27.26.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

<https://github.com/zulily/buoyant>

### 27.26.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

<https://github.com/elasticdog/salt-sandbox>

### 27.26.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

<https://github.com/UtahDave/salt-vagrant-demo>

## RELEASE NOTES

See the version numbers page for more information about the version numbering scheme.

### 28.1 Latest Branch Release

Release Candidate

### 28.2 Previous Releases

#### 28.2.1 Salt 2019.2.0 Release Notes - Codename Fluorine

##### Python 2.7 Deprecation

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the Sodium release, that is either the Sodium release or a later release. This decision is pending further community discussion.

##### Non-Backward-Compatible Change to YAML Renderer

In earlier releases, this was considered valid usage in Python 2, assuming that `data` was a list or dictionary containing keys/values which are `unicode` types:

```
/etc/foo.conf:
 file.managed:
 - source: salt://foo.conf.jinja
 - template: jinja
 - context:
 data: {{ data }}
```

One common use case for this is when using one of Salt's *custom Jinja filters* which return lists or dictionaries, such as the *ipv4* filter.

In Python 2, Jinja will render the `unicode` string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the *tojson Jinja filter*:

```
/etc/foo.conf:
 file.managed:
 - source: salt://foo.conf.jinja
 - template: jinja
 - context:
 data: {{ data|tojson }}
```

Another example where the new filter needs to be used is the following state example:

```
grafana_packages:
 pkg.installed:
 - names: {{ server.pkgs }}
```

This will fail when `pkgs` is a list or dictionary. You will need to update the state:

```
grafana_packages:
 pkg.installed:
 - names: {{ server.pkgs|tojson }}
```

This test case has also been tested with the `yaml` and `json` filters successfully.

---

**Note:** This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a `tojson` filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

---

---

**Important:** The `json_encode_dict` and `json_encode_list` filters do not actually dump the results to JSON. Since `tojson` accomplishes what those filters were designed to do, they are now deprecated and will be removed in the Neon release. The `tojson` filter should be used in all cases where `json_encode_dict` and `json_encode_list` would have been used.

---

## Ansible Playbook State and Execution Modules

Along with the including the `ansible` modules in the Oxygen release, running playbooks has been added in 2019.2.0 with the `playbooks` function. This also includes an `ansible playbooks state module` which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

```
install nginx:
 ansible.playbooks:
 - name: install.yml
 - git_repo: git://github.com/gtmanfred/playbook.git
 - git_kwargs:
 rev: master
```

The playbooks modules also includes the ability to specify a git repo to clone and use, or a specific directory can be used when running the playbook.

## Network Automation

Beginning with this release, Salt provides much broader support for a variety of network operating systems, and features for configuration manipulation or operational command execution.

## NetBox

Added in the previous release, 2018.3.0, the capabilities of the *netbox* Execution Module have been extended, with a much longer list of available features:

- *netbox.create\_circuit*
- *netbox.create\_circuit\_provider*
- *netbox.create\_circuit\_termination*
- *netbox.create\_circuit\_type*
- *netbox.create\_device*
- *netbox.create\_device\_role*
- *netbox.create\_device\_type*
- *netbox.create\_interface*
- *netbox.create\_interface\_connection*
- *netbox.create\_inventory\_item*
- *netbox.create\_ipaddress*
- *netbox.create\_manufacturer*
- *netbox.create\_platform*
- *netbox.create\_site*
- *netbox.delete\_interface*
- *netbox.delete\_inventory\_item*
- *netbox.delete\_ipaddress*
- *netbox.get\_circuit\_provider*
- *netbox.get\_interfaces*
- *netbox.get\_ipaddresses*
- *netbox.make\_interface\_child*
- *netbox.make\_interface\_lag*
- *netbox.openconfig\_interfaces*
- *netbox.openconfig\_lacp*
- *netbox.update\_device*
- *netbox.update\_interface*

Besides this Execution Module, Salt users can load data directly from NetBox into the device Pillar, via the *netbox* External Pillar module.

## Netmiko

*Netmiko*, the multi-vendor library to simplify Paramiko SSH connections to network devices, is now officially integrated into Salt. The network community can use it via the *netmiko* Proxy Module or directly from any Salt Minions, passing the connection credentials - see the documentation for the *netmiko* Execution Module.

## Arista

Arista switches can now be managed running under the *pyeapi* Proxy Module, and execute RPC requests via the *pyeapi* Execution Module.

## Cisco Nexus

While support for SSH-based operations has been added in the release codename Carbon (2016.11), the new *nxos\_api* Proxy Module and *nxos\_api* allow management of Cisco Nexus switches via the NX-API.

It is important to note that these modules don't have third party dependencies, therefore they can be used straight away from any Salt Minion. This also means that the user may be able to install the regular Salt Minion on the Nexus switch directly and manage the network devices like a regular server.

## General-purpose Modules

The new *ciscoconfparse* Execution Module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), as well as brace-delimited configuration style.

The *iosconfig* can be used for various configuration manipulation for Cisco IOS style configuration, such as: *configuration cleanup*, *tree representation of the config*, etc.

## NAPALM

### Commit At and Commit Confirmed

Beginning with this release, NAPALM users are able to execute scheduled commits (broadly known as "commit at") and "commit confirmed" (revert the configuration change unless the user confirms by running another command). These features are available via the `commit_in`, `commit_at`, `revert_in`, or `revert_at` arguments for the *net.load\_config* and *net.load\_template* execution functions, or *netconfig.managed*.

The counterpart execution functions *net.confirm\_commit*, or *net.cancel\_commit*, as well as the State functions *netconfig.commit\_cancelled*, or *netconfig.commit\_confirmed* can be used to confirm or cancel a commit.

Please note that the commit confirmed and commit cancelled functionalities are available for any platform whether the network devices supports the features natively or not. However, be cautious and make sure you read and understand the caveats before using them in production.

### Multiple Templates Rendered Simultaneously

The `template_name` argument of the *net.load\_template* Execution and *netconfig.managed* State function now supports a list of templates. This is particularly useful when a very large Jinja template is split into multiple smaller and easier to read templates that can eventually be reused in other States. For example, the following syntax is not correct to manage the configuration of NTP and BGP simultaneously, using two different templates and changing the device configuration through one single commit:

```
manage_bgp_and_ntp:
 netconfig.managed:
 - template_name:
```

(continues on next page)

(continued from previous page)

```

- salt://templates/bgp.jinja
- salt://templates/ntp.jinja
- context:
 bpg: {{ pillar.bgp }}
 ntp: {{ pillar.ntp }}

```

## Connection Re-establishment on Demand

Beginning with this release, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need to execute a command on the device but is connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead:

```
salt '*' net.arp username=my-alt-usr force_reconnect=True
```

The same goes with any of the other configuration arguments required for the NAPALM connection - see [NAPALM proxy documentation](#).

## Configuration Replace Features

To replace various configuration chunks, you can use the new `net.replace_pattern` execution function, or the `netconfig.replace_pattern` State function. For example, if you want to update your configuration and rename a BGP policy referenced in many places, you can do so by running:

```
salt '*' net.replace_pattern OLD-POLICY-CONFIG new-policy-config
```

Similarly, you can also replace entire configuration blocks using the `net.blockreplace` function.

## Configuration Save Features

The `net.save_config` function can be used to save the configuration of the managed device into a file. For the State subsystem, the `netconfig.saved` function has been added which provides a complete list of facilities when managing the target file where the configuration of the network device can be saved.

For example, backup the running configuration of each device under its own directory tree:

```

/var/backups/{{ opts.id }}/running.cfg:
netconfig.saved:
- source: running
- makedirs: true

```

All the new network automation modules mentioned above are directly exposed to the NAPALM users, without requiring any architectural changes, just eventually install some requirements:

### Junos

The features from the existing *junos* Execution Module are available via the following functions:

- *napalm.junos\_cli*: Execute a CLI command and return the output as text or Python dictionary.
- *napalm.junos\_rpc*: Execute an RPC request on the remote Junos device, and return the result as a Python dictionary, easy to digest and manipulate.
- *napalm.junos\_install\_os*: Install the given image on the device.
- *napalm.junos\_facts*: The complete list of Junos facts collected by the *junos-eznc* underlying library.

---

**Note:** To be able to use these features, you must ensure that you meet the requirements for the *junos* module. As *junos-eznc* is already a dependency of NAPALM, you will only have to install *jxmlease*.

---

Usage examples:

```
salt '*' napalm.junos_cli 'show arp' format=xml
salt '*' napalm.junos_rpc get-interface-information
```

### Netmiko

The features from the newly added *netmiko* Execution Module are available as:

- *napalm.netmiko\_commands*: Execute one or more commands to be executed on the remote device, via Netmiko, and return the output as a text.
- *napalm.netmiko\_config*: Load a list of configuration commands on the remote device, via Netmiko. The commands can equally be loaded from a local or remote path, and passed through Salt's template rendering pipeline (by default using Jinja as the template rendering engine).

Usage examples:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
salt '*' napalm.netmiko_config config_file=https://bit.ly/2sgljCB
```

### Arista pyeapi

For various operations and various extension modules, the following features have been added to gate functionality from the *pyeapi* module:

- *napalm.pyeapi\_run\_commands*: Execute a list of commands on the Arista switch, via the *pyeapi* library.
- *napalm.pyeapi\_config*: Configure the Arista switch with the specified commands, via the *pyeapi* Python library. Similarly to *napalm.netmiko\_config*, you can use both local and remote files, with or without templating.

Usage examples:

```
salt '*' napalm.pyeapi_run_commands 'show version' 'show interfaces'
salt '*' napalm.pyeapi_config config_file=salt://path/to/template.jinja
```

## Cisco NX-API

In the exact same way as above, the user has absolute control by using the following primitives to manage Cisco Nexus switches via the NX-API:

- *napalm.nxos\_api\_show*: Execute one or more show (non-configuration) commands, and return the output as plain text or Python dictionary.
- *napalm.nxos\_api\_rpc*: Execute arbitrary RPC requests via the Nexus API.
- *napalm.nxos\_api\_config*: Configures the Nexus switch with the specified commands, via the NX-API. The commands can be loaded from the command line, or a local or remote file, eventually rendered using the templating engine of choice (default: `jinja`).

Usage examples:

```
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

## Ciscoconfparse

The following list of function may be handy when manipulating Cisco IOS or Junos style configurations:

- *napalm.config\_filter\_lines*: Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent and children respect the regular expressions provided.
- *napalm.config\_find\_lines*: Return the configuration lines that match the regular expression provided.
- *napalm.config\_lines\_w\_child*: Return the configuration lines that match a regular expression, having child lines matching the child regular expression.
- *napalm.config\_lines\_wo\_child*: Return the configuration lines that match a regular expression, that don't have child lines matching the child regular expression.

---

**Note:** These functions require the `ciscoconfparse` Python library to be installed.

---

Usage example (find interfaces that are administratively shut down):

```
salt '*' napalm.config_lines_w_child 'interface' 'shutdown'
```

## IOSConfig

For Cisco IOS style configuration, the following features have been added to the *napalm* Execution Module:

- *napalm.config\_tree*: Transform Cisco IOS style configuration to structured Python dictionary, using the configuration of the interrogated network device.
- *napalm.config\_merge\_tree*: Return the merge tree of the configuration of the managed network device with a different configuration to be merged with (without actually loading any changes on the device).

- `napalm.config_merge_text`: Return the merge result (as text) of the configuration of the managed network device with a different configuration to be merged with.
- `napalm.config_merge_diff`: Return the merge diff after merging the configuration of the managed network device with a different configuration (without actually loading any changes on the device).

## SCP

Reusing the already available connection credentials provided for NAPALM, the following features are now available:

- `napalm.scp_put`: Transfer files and directories to remote network device.
- `napalm.scp_get`: Transfer files and directories from remote network device to the localhost of the Minion.

## PeeringDB

The `peeringdb` Execution Module is useful to gather information about other networks you can potentially peer with, and automatically establish BGP sessions, e.g., given just a specific AS number, the rest of the data (i.e., IP addresses, locations where the remote network is available, etc.) is retrieved from PeeringDB, and the session configuration is automated with minimal to no effort (typing the IP addresses manually can be both tedious and error prone).

## New Docker Proxy Minion

Docker containers can now be treated as actual minions without installing salt in the container, using the new `docker proxy minion`.

This proxy minion uses the `docker executor` to pass commands to the docker container using `docker.call`. Any state module calls are passed through the corresponding function from the `docker` module.

```
proxy:
 proxytype: docker
 name: keen_proskuriakova
```

## Terraform Salt-SSH Roster

You can now dynamically generate a Salt-SSH roster from the terraform resources defined with `terraform-provider-salt`.

This allows you to combine both terraform and Salt-SSH to provision and configure your hosts. See the `terraform roster` for an example on how to setup and use.

## Grains Dictionary Passed into Custom Grains

Starting in this release, if a custom grains function accepts a variable named `grains`, the Grains dictionary of the already compiled grains will be passed in. Because of the non-deterministic order that grains are rendered in, the only grains that can be relied upon to be passed in are `core.py` grains, since those are compiled first.

## More Precise `virtual` Grain

This release improves the accuracy of the `virtual` grain when running Salt in a nested virtualization environment (e.g. `systemd-nspawn` container inside a VM) and having `virt-what` installed.

Until now, the `virtual` grain was determined by matching against all output lines of `virt-what` instead of individual items which could lead to not quite precise results (e.g. reporting HyperV inside a `systemd-nspawn` container running within a Hyper-V-based VM).

## Configurable Module Environment

Salt modules (states, execution modules, returners, etc.) now can have custom environment variables applied when running shell commands. This can be configured by setting a `system-environment` key either in Grains or Pillar. The syntax is as follows:

```
system-environment:
<type>
 <module>:
 # Namespace for all functions in the module
 -:
 <key>: <value>

 # Namespace only for particular function in the module
 <function>:
 <key>: <value>
```

- `<type>` would be the type of module (i.e. `states`, `modules`, etc.).
- `<module>` would be the module's name.

---

**Note:** The module name can be either the virtual name (e.g. `pkg`), or the physical name (e.g. `yumpkg`).

---

- `<function>` would be the function name within that module. To apply environment variables to *all* functions in a given module, use an underscore (i.e. `_`) as the function name. For example, to set the same environment variable for all package management functions, the following could be used:

```
system-environment:
modules:
 pkg:
 -:
 SOMETHING: for_all
```

To set an environment variable in `pkg.install` only:

```
system-environment:
modules:
 pkg:
 install:
 LC_ALL: en_GB.UTF-8
```

To set the same variable but only for SUSE minions (which use `zypper` for package management):

```
system-environment:
modules:
 zypper:
```

(continues on next page)

(continued from previous page)

```
install:
 LC_ALL: en_GB.UTF-8
```

**Note:** This is not supported throughout Salt; the module must explicitly support this feature (though this may change in the future). As of this release, the only modules which support this are the following `pkg` virtual modules:

- `aptpkg`
- `yumpkg`
- `zypper`

### ”Virtual Package” Support Dropped for APT

In APT, some packages have an associated list of packages which they provide. This allows one to do things like run `apt-get install foo` when the real package name is `foo1.0`, and get the right package installed.

Salt has traditionally designated as ”virtual packages” those which are provided by an installed package, but for which there is no real package by that name installed. Given the above example, if one were to run a `pkg.installed` state for a package named `foo`, then `pkg.list_pkgs` would show a package version of simply `1` for package `foo`, denoting that it is a virtual package.

However, while this makes certain aspects of package management convenient, there are issues with this approach that make relying on ”virtual packages” problematic. For instance, Ubuntu has four different mutually-conflicting packages for `nginx`:

- `nginx-core`
- `nginx-full`
- `nginx-light`
- `nginx-extras`

All four of these provide `nginx`. Yet there is an `nginx` package as well, which has no actual content and merely has dependencies on any one of the above four packages. If one used `nginx` in a `pkg.installed` state, and none of the above four packages were installed, then the `nginx` metapackage would be installed, which would pull in `nginx-core_`. Later, if `nginx` were used in a `pkg.removed` state, the `nginx` metapackage would be removed, leaving `nginx-core` installed. The result would be that, since `nginx-core_` provides `nginx_`, Salt would now see `nginx` as an installed virtual package, and the `pkg.removed` state would fail. Moreover, `nginx` would not actually have been removed, since `nginx-core` would remain installed.

Starting with this release, Salt will no longer support using ”virtual package” names in `pkg` states, and package names will need to be specified using the proper package name. The `pkg.list_repo_pkgs` function can be used to find matching package names in the repositories, given a package name (or glob):

```
salt myminion pkg.list_repo_pkgs 'nginx*'
myminion:

 nginx:
 - 1.10.3-0ubuntu0.16.04.2
 - 1.9.15-0ubuntu1
 nginx-common:
 - 1.10.3-0ubuntu0.16.04.2
 - 1.9.15-0ubuntu1
 nginx-core:
```

(continues on next page)

(continued from previous page)

```

- 1.10.3-0ubuntu0.16.04.2
- 1.9.15-0ubuntu1

## Minion Startup Events

When a minion starts up it sends a notification on the event bus with a tag that looks like this: `salt/minion/<minion_id>/start`. For historical reasons the minion also sends a similar event with an event tag like this: `minion_start`. This duplication can cause a lot of clutter on the event bus when there are many minions. Set `enable_legacy_startup_events: False` in the minion config to ensure only the `salt/minion/<minion_id>/start` events are sent.

The new `enable_legacy_startup_events` minion config option defaults to `True`, but will be set to default to `False` beginning with the Sodium release of Salt.

The Salt Syndic currently sends an old style `syndic_start` event as well. The syndic respects `enable_legacy_startup_events` as well.

### Failhard changes

It is now possible to override a global failhard setting with a state-level failhard setting. This is most useful in case where global failhard is set to `True` and you want the execution not to stop for a specific state that could fail, by setting the state level failhard to `False`. This also allows for the use of `onfail*-requisites`, which would previously be ignored when a global failhard was set to `True`. This is a deviation from previous behavior, where the global failhard setting always resulted in an immediate stop whenever any state failed (regardless of whether the failing state had a failhard setting of its own, or whether any `onfail*-requisites` were used).

### Pass Through Options to `file.serialize` State

This allows for more granular control over the way in which the dataset is serialized. See the documentation for the new `serializer_opts` and `deserializer_opts` options in the `file.serialize` state for more information.

### `file.patch` State Rewritten

The `file.patch` state has been rewritten with several new features:

- Patch sources can now be remote files instead of only `salt://` URLs
- Multi-file patches are now supported
- Patch files can be templated

In addition, it is no longer necessary to specify what the hash of the patched file should be.

### New `no_proxy` Minion Configuration

Pass a list of hosts using the `no_proxy` minion config option to bypass an HTTP proxy.

---

**Note:** This key does nothing unless `proxy_host` is configured and it does not support any kind of wildcards.

---

```
no_proxy: ['127.0.0.1', 'foo.tld']
```

### Changes to `slack` Engine

The output returned to Slack from functions run using this engine is now formatted using that function's proper outputter. Earlier releases would format the output in YAML for all functions except for when states were run.

## Enhancements to *wtmp* Beacon

A new key, `action`, has been added to the events fired by this beacon, which will contain either the string `login` or `logout`. This will simplify reactors which use this beacon's data, as it will no longer be necessary to check the integer value of the `type` key to know whether the event is a login or logout.

Additionally, in the event that your platform has a non-standard `utmp.h`, you can now configure which type numbers indicate a login and logout.

See the [\*wtmp beacon documentation\*](#) for more information.

## Deprecations

### API Deprecations

Support for *LocalClient*'s `expr_form` argument has been removed. Please use `tgt_type` instead. This change was made due to numerous reports of confusion among community members, since the targeting method is published to minions as `tgt_type`, and appears as `tgt_type` in the job cache as well.

Those who are using the *LocalClient* (either directly, or implicitly via a *netapi module*) need to update their code to use `tgt_type`.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'], tgt_type='glob')
{'jerry': 'root'}
```

### Minion Configuration Deprecations

The `master_shuffle` configuration option is deprecated as of the 2019.2.0 release. Please use the `random_master` option instead.

### Module Deprecations

- The *napalm\_network* module has been changed as follows:
  - Support for the `template_path` has been removed from `net.load_template` function. This is because support for NAPALM native templates has been dropped.
- The *pip* module has been changed as follows:
  - Support for the `no_chown` option has been removed from `pip.install` function.
- The *trafficserver* module has been changed as follows:
  - The `trafficserver.match_var` function was removed. Please use `trafficserver.match_metric` instead.
  - The `trafficserver.read_var` function was removed. Please use `trafficserver.read_config` instead.
  - The `trafficserver.set_var` function was removed. Please use `trafficserver.set_config` instead.
- The *win\_update* module has been removed. It has been replaced by *win\_wua*.
- The *win\_wua* module has been changed as follows:

- The `win_wua.download_update` and `win_wua.download_updates` functions have been removed. Please use `win_wua.download` instead.
- The `win_wua.install_update` and `win_wua.install_updates` functions have been removed. Please use `win_wua.install` instead.
- The `win_wua.list_update` function has been removed. Please use functions have been removed. Please use `win_wua.get` instead.
- The `win_wua.list_updates` function has been removed. Please use functions have been removed. Please use `win_wua.list` instead.

## Pillar Deprecations

- The `vault` external pillar has been changed as follows:
  - Support for the `profile` argument was removed. Any options passed up until and following the first `path=` are discarded.

## Roster Deprecations

- The `cache` roster has been changed as follows:
  - Support for `roster_order` as a list or tuple has been removed. As of the 2019.2.0 release, `roster_order` must be a dictionary.
  - The `roster_order` option now includes IPv6 in addition to IPv4 for the `private`, `public`, `global` or `local` settings. The syntax for these settings has changed to `ipv4-*` or `ipv6-*`, respectively.

## State Deprecations

- The `docker` state module has been removed
  - In 2017.7.0, the states from this module were split into four separate state modules:
    - \* `docker_container`
    - \* `docker_image`
    - \* `docker_volume`
    - \* `docker_network`
  - The `docker` module remained, for backward-compatibility, but it has now been removed. Please update SLS files to use the new state names:
    - \* `docker.running` => `docker_container.running`
    - \* `docker.stopped` => `docker_container.stopped`
    - \* `docker.absent` => `docker_container.absent`
    - \* `docker.network_present` => `docker_network.present`
    - \* `docker.network_absent` => `docker_network.absent`
    - \* `docker.image_present` => `docker_image.present`
    - \* `docker.image_absent` => `docker_image.absent`
    - \* `docker.volume_present` => `docker_volume.present`

\* `docker.volume_absent => docker_volume.absent`

- The `docker_network` state module has been changed as follows:
  - The `driver` option has been removed from `docker_network.absent`. It had no functionality, as the state simply deletes the specified network name if it exists.
- The deprecated `ref` option has been removed from the `git.detached` state. Please use `rev` instead.
- The `k8s` state module has been removed in favor of the `kubernetes` state module. Please update SLS files as follows:
  - In place of `k8s.label_present`, use `kubernetes.node_label_present`
  - In place of `k8s.label_absent`, use `kubernetes.node_label_absent`
  - In place of `k8s.label_folder_absent`, use `kubernetes.node_label_folder_absent`
- Support for the `template_path` option in the `netconfig.managed` `<salt.states.netconfig.managed()` state has been removed. This is because support for NAPALM native templates has been dropped.
- Support for the `no_chown` option in the `pip.installed` state has been removed.
- The `trafficserver.set_var` state has been removed. Please use `trafficserver.config` instead.
- Support for the `no_chown` option in the `py:func'virtualenv.managed` `<salt.states.virtualenv.managed>` function has been removed.
- The `win_update` state module has been removed. It has been replaced by `win_wua`.
- Support for virtual packages has been removed from the `py:mod:pkg state` `<salt.states.pkg>`.

## Utils Deprecations

The `cloud` utils module had the following changes:

- Support for the `cache_nodes_ip` function in `salt utils` module has been removed. The function was incomplete and non-functional.

The `vault` utils module had the following changes:

- Support for specifying Vault connection data within a 'profile' has been removed. Please see the [vault execution module](#) documentation for details on the new configuration schema.

## Dependency Deprecations

Salt-Cloud has been updated to use the `pypsexec` Python library instead of the `winexe` executable. Both `winexe` and `pypsexec` run remote commands against Windows OSes. Since `winexe` is not packaged for every system, it has been deprecated in favor of `pypsexec`.

Salt-Cloud has deprecated the use of `impacket` in favor of `smbprotocol`. This change was made because `impacket` is not compatible with Python 3.

## SaltSSH major updates

SaltSSH now works across different major Python versions. Python 2.7 ~ Python 3.x are now supported transparently. Requirement is, however, that the SaltMaster should have installed Salt, including all related dependencies for Python 2 and Python 3. Everything needs to be importable from the respective Python environment.

SaltSSH can bundle up an arbitrary version of Salt. If there would be an old box for example, running an outdated and unsupported Python 2.6, it is still possible from a SaltMaster with Python 3.5 or newer to access it. This feature requires an additional configuration in `/etc/salt/master` as follows:

```
ssh_ext_alternatives:
 2016.3: # Namespace, can be actually anything.
 py-version: [2, 6] # Constraint to specific interpreter version
 path: /opt/2016.3/salt # Main Salt installation
 dependencies: # List of dependencies and their installation paths
 jinja2: /opt/jinja2
 yaml: /opt/yaml
 tornado: /opt/tornado
 msgpack: /opt/msgpack
 certifi: /opt/certifi
 singledispatch: /opt/singledispatch.py
 singledispatch_helpers: /opt/singledispatch_helpers.py
 markupsafe: /opt/markupsafe
 backports_abc: /opt/backports_abc.py
```

It is also possible to use several alternative versions of Salt. You can for instance generate a minimal tarball using runners and include that. But this is only possible, when such specific Salt version is also available on the Master machine, although does not need to be directly installed together with the older Python interpreter.

SaltSSH now support private key's passphrase. You can configure it by:

- `-priv-passwd` for salt-ssh cli
- `salt_priv_passwd` for salt master configure file
- `priv_passwd` for salt roster file

## State Module Changes

### salt State Module (used in orchestration)

The `test` option now defaults to `None`. A value of `True` or `False` set here is passed to the state being run and can be used to override a `test: True` option set in the minion's config file. In previous releases the minion's config option would take precedence and it would be impossible to run an orchestration on a minion with test mode set to `True` in the config file.

If a minion is not in permanent test mode due to the config file and the 'test' argument here is left as `None` then a value of `test=True` on the command-line is passed correctly to the minion to run an orchestration in test mode. At present it is not possible to pass `test=False` on the command-line to override a minion in permanent test mode and so the `test: False` option must still be set in the orchestration file.

### event.send State

The `event.send` state does not know the results of the sent event, so returns `changed` every state run. It can now be set to return `changed` or `unchanged`.

### influxdb\_user.present Influxdb User Module State

The `password` parameter has been changed to `passwd` to remove the name collusion with the influxdb client configuration (`client_kwargs`) allowing management of users when authentication is enabled on the influxdb instance

Old behavior:

```
influxdb_user.present:
- name: exampleuser
- password: exampleuserpassword
- user: admin
- password: adminpassword
```

New behavior:

```
influxdb_user.present:
- name: exampleuser
- passwd: exampleuserpassword
- user: admin
- password: adminpassword
```

## winrepo\_cache\_expire\_min Windows Package Definitions Caching

The `winrepo_cache_expire_min` has been changed from 0 to 1800 (30 minutes) For example if you run highstate the package definitions are normally updated, however now if the package definitions are younger than `winrepo_cache_expire_min` (30 minutes) the package definitions will not be refreshed, reducing the amount of time taken to run a 2nd highstate. To get the old behaviour change the value back to 0 in the minion configuration file. This also effects the behaviour of other functions which default to refresh. The `pkg.refresh_db` will always refresh the package definitions.

## LDAP External Authentication

### freeipa groupattribute support

Previously, if Salt was using external authentication against a freeipa LDAP system it could only search for users via the `accountattributename` field. This release add an additional search using the `groupattribute` field as well. The original `accountattributename` search is done first then the `groupattribute` allowing for backward compatibility with previous Salt releases.

## Jinja Include Relative Paths

When a jinja include template name begins with `./` or `../` then the import will be relative to the importing file.

Prior practices required the following construct:

```
{% from tpldir ~ '/foo' import bar %}
```

A more "natural" construct is now supported:

```
{% from './foo' import bar %}
```

Comparatively when importing from a parent directory - prior practice:

```
{% from tpldir ~ '/../foo' import bar %}
```

New style for including from a parent directory:

```
{% from '../foo' import bar %}
```

## salt-api

### salt-api Windows support

Previously, salt-api was not supported on the Microsoft Windows platforms. Now it is! salt-api provides a RESTful interface to a running Salt system. It allows for viewing minions, runners, and jobs as well as running execution modules and runners of a running Salt system through a REST API that returns JSON. See *Salt-API* documentation. .. \_Salt-API: <https://docs.saltstack.com/en/latest/topics/netapi/index.html>

## Logging Changes

### Include Job ID (JID) in Minion and Master Logs

The Job ID (JID) can now be optionally included in both the minion and master logs by including `jid` in either the `log_fmt_console` or `log_fmt_logfile` configuration option:

```
log_fmt_console: "[%(\levelname)-8s] %(jid)s %(message)s"
```

This will cause the JID to be included in any log entries that are related to a particular Salt job. The JID will be included using the default format, `[JID: %(jid)s]` but can be overridden with the `log_fmt_jid` configuration item.

```
log_fmt_jid: "[JID: %(jid)s]"
```

## Security

### Windows runas changes

A password is no longer required with `runas` under normal circumstances. The password option is only needed if the minion process is run under a restricted (non-administrator) account. In the aforementioned case, a password is only required when using the `runas` argument to run command as a different user.

## New Modules

### Execution Modules

- `salt.modules.ciscoconfparse_mod`
- `salt.modules.jira`
- `salt.modules.google_chat`
- `salt.modules.iosconfig`
- `salt.modules.netmiko`
- `salt.modules.nxos_api`
- `salt.modules.peeringdb`
- `salt.modules.purefb`

- `salt.modules.pyeapi`

### Pillar Modules

- `netbox`

### Proxy Modules

- `salt.proxy.netmiko`
- `salt.proxy.nxos_api`
- `salt.proxy.pyeapi`

## 28.2.2 Salt 2019.2.1 Release Notes

Version 2019.2.1 is a bugfix release for *2019.2.0*.

### Known Issues

- **ISSUE #54751:** Proxy minion fails to start. Fix planned in 2019.2.2 release.
- **ISSUE #54762:** URIs with IPv6 addresses are broken, preventing master-minion communication in IPv6-only environments. Fix planned in 2019.2.2 release.
- **ISSUE #54776:** Minion fails to start when it contains `ping_interval` in minion configuration file. Fix planned in 2019.2.2 release.
- **ISSUE #54731:** Returners (except for default salt master returner) not loading properly in Py3. Fix planned in 2019.2.2 release.
- **ISSUE #54758:** `salt-call state.show_states` gives "Passed invalid arguments" error when a sls defined in top.sls file is missing. Fix planned in 2019.2.2 release.
- **ISSUE #54765:** Jinja from import is broken. Fix planned in 2019.2.2 release.
- **ISSUE #54771:** Affects only Debian 10. `pkgrepo.managed` does not work if used with proxy (configured at salt-minion). No fix date available yet.
- **ISSUE #54759:** Deprecation warnings for `pyzmq`. No fix date available yet.

### Change to YAML Renderer

```
/etc/foo.conf:
 file.managed:
 - source: salt://foo.conf.jinja
 - template: jinja
 - context:
 data: {{ data }}
```

In 2019.2.0, the above SLS will result in an error message following changes to the YAML renderer that now require the new Jinja filter `tojson`.

```
/etc/foo.conf:
 file.managed:
 - source: salt://foo.conf.jinja
 - template: jinja
 - context:
 data: {{ data|tojson }}
```

In 2019.2.1, we introduce a new configuration option for both the Salt master and Salt minion configurations to be able to support the older YAML renderer. Using the option `use_yamlloader_old` will allow the YAML renderer to function as before.

### Statistics

- Total Merges: 541
- Total Issue References: 70
- Total PR References: 355
- Contributors: 49 (Akm0d, Ch3LL, DmitryKuzmenko, Ethyling, FireGrace, KChandrashekhar, ScoreUnder, amendlik, aplanas, arsieysys, bbinet, bryceml, cbosdo, cdalvaro, chdamianos, cmcmarrow, cro, damianosSemmler, dmunphy18, doesitblend, dwoz, felippeb, frogunder, garethgreenaway, github-abcde, isbm, jfindlay, lomeroy, mattLLVW, mattp-, mirceaulinic, nicholasmhughes, rbthomp, rombert, rsmekala, s0undt3ch, sathieu, sbrennan4, sdodsley, simonflood, sjorge, soer7022, stratusjerry, tanlingyun2005, terminalmage, twangboy, waynew, weswhet, xuhcc)

### Changelog for v2019.2.0..v2019.2.1

Generated at: 2019-09-09 19:56:22 UTC

- **ISSUE #54429:** (frogunder) [2019.2.1] Sudo user error (refs: #54433)
- **PR #54433:** (dwoz) Re-gen executors with proper arguments @ 2019-09-09 19:14:05 UTC
  - 62fc61c Merge pull request #54433 from dwoz/sudo\_minion
  - e08eb19 Merge branch '2019.2.1' into sudo\_minion
- **PR #54434:** (frogunder) fix\_docs @ 2019-09-09 18:55:28 UTC
  - 76fac57 Merge pull request #54434 from frogunder/fix\_doc
  - 2d22d73 fix\_docs error
  - a266a5c fix\_docs
  - db5464a Fix linter warts
  - 144a600 Re-gen executors with proper arguments
- **PR #54424:** (frogunder) remove in progress from release\_notes 2019.2.1 @ 2019-09-05 23:11:03 UTC
  - 4071dcb Merge pull request #54424 from frogunder/releasenotes\_201921\_new
  - b66436f Update 2019.2.1.rst
  - bcfef11 remove in progress from release\_notes 2019.2.1
- **PR #54416:** (frogunder) Update man\_pages for 2019.2.1 @ 2019-09-05 22:48:51 UTC
  - c1587cc Merge pull request #54416 from frogunder/man\_pages\_201921

- 6f7c4ee Update man\_pages for 2019.2.1
- **PR #54419:** (frogunder) releasenotes 2019.2.1 @ 2019-09-05 22:48:42 UTC
  - 3118e2f Merge pull request #54419 from frogunder/release\_notes\_201921
  - 2caee96 Update doc/topics/releases/2019.2.1.rst

  - 72cb24c releasenotes 2019.2.1
- **PR #54409:** (dwoz) Point salt-call to correct multi-master configs @ 2019-09-04 20:08:24 UTC
  - 04e28cf Merge pull request #54409 from dwoz/mm\_log
  - e207de6 Point salt-call to correct multi-master configs
- **PR #54396:** (dwoz) Use different logging port for multimaster tests @ 2019-09-03 23:20:23 UTC
  - 2c281e0 Merge pull request #54396 from dwoz/multimaster\_logging
  - 104e0a0 Use different logging port for multimaster tests
- **ISSUE #54256:** (sleminov-tc) Empty salt api token file breaks maintenance process. (refs: #54325, #54324, #54388, #54376)
- **ISSUE #37945:** (gstachowiak) Missing exception handling in salt.master.Maintenance. Process never completes. (refs: #54325, #54324, #54388, #54376)
- **PR #54388:** (dwoz) 54256 re fix empty api token 2019.2.1 @ 2019-09-03 23:19:20 UTC
  - **PR #54325:** (waynew) Delete bad API token files (refs: #54388)
  - **PR #54324:** (waynew) Delete bad API token files (refs: #54325, #54388)
  - 730a007 Merge pull request #54388 from dwoz/54256-re-fix-empty-api-token-2019.2.1
  - 80651d3 Fix linter
  - 982ed3d Delete bad API token files
- **ISSUE #54256:** (sleminov-tc) Empty salt api token file breaks maintenance process. (refs: #54325, #54324, #54388, #54376)
- **ISSUE #37945:** (gstachowiak) Missing exception handling in salt.master.Maintenance. Process never completes. (refs: #54325, #54324, #54388, #54376)
- **PR #54376:** (dwoz) Move tokens in place with an atomic operation @ 2019-09-03 20:40:50 UTC
  - 11016ce Merge pull request #54376 from dwoz/tmp\_token
  - 0b28c60 Fix linter complaints
  - 8e33343 Move tokens in place with an atomic operation
- **PR #54386:** (twangboy) Fix unit.utils.test\_win\_dacl (2019.2.1) @ 2019-09-03 16:57:25 UTC
  - 5161203 Merge pull request #54386 from twangboy/fix\_test\_win\_dacl\_2019.2.1
  - b8fa7d3 Sort the perms
- **PR #54355:** (s0undt3ch) [2019.2.1] [GitPillar Tests] Have the started processes log instead of just writing to stdout/stderr @ 2019-08-29 23:26:50 UTC

- b4caaad Merge pull request #54355 from s0undt3ch/hotfix/test-daemons-2019.2.1
- 561c0a2 Have the started processes log instead of just writing to stdout/stderr
- c2a3115 Don't overwritethe stderr logger
- PR #54353: (cmcmarrow) adds @skipIf not windows @ 2019-08-29 19:33:11 UTC
  - ce5b109 Merge pull request #54353 from cmcmarrow/2019\_win\_system\_skip
  - 8e28074 adds @skipIf not windows
- PR #54338: (dwoz) Log server closes completely during shutdown @ 2019-08-29 17:14:05 UTC
  - 94c03e5 Merge pull request #54338 from dwoz/logging\_fixup
  - a3e227e Log server closes completely durring shutdown
- PR #54327: (garethgreenaway) [2019.2.1] Catch the AccessDenied exception and continue when running under Py3. @ 2019-08-29 16:59:34 UTC
  - 490ee69 Merge pull request #54327 from garethgreenaway/more\_test\_program\_fixes
  - 97b4d86 Catch the AccessDenied exception and continue when running under Py3.
- PR #54316: (Akm0d) Azure cleanup @ 2019-08-27 16:14:09 UTC
  - bb911c3 Merge pull request #54316 from Akm0d/azure-cleanup
  - 2072773 pass longer timeout to msazure destroyinstance
  - 34eb477 Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into azure-cleanup
  - 7ae48b1 Allow azure tests enough time to clean up interfaces
  - b45ae74 Clean up azure instances properly
- PR #54314: (garethgreenaway) [2019.2.1] Do not raise the exception in testprogram.py @ 2019-08-26 23:59:37 UTC
  - 9334e4e Merge pull request #54314 from garethgreenaway/testprogram\_access\_denied\_do\_not\_raise
  - a53bacb Do not raise the exception if a process can not be access, just continue
- PR #54305: (dwoz) Fix wart in test\_process tests on windows @ 2019-08-26 17:59:12 UTC
  - 71fb051 Merge pull request #54305 from dwoz/winfix
  - 4e68860 Fix wart in test\_process tests on windows
- PR #54303: (dwoz) Fix wart in periodic callback interval @ 2019-08-24 20:04:35 UTC
  - 4d80f0a Merge pull request #54303 from dwoz/periodic\_cb
  - bf5f7de Fix wart in periodic callback interval
- ISSUE #54219: (KChandrashekhar) integration.shell.test\_call.py and tests/integration/shell/test\_proxy.py (refs: #54259)
- ISSUE #54153: (KChandrashekhar) Ubuntu 16.04 Proxy failures (refs: #54259)
- PR #54259: (dwoz) Call os.fork less to avoid race conditions @ 2019-08-24 02:12:42 UTC
  - 5838851 Merge pull request #54259 from dwoz/less\_forking
  - bf4d0dd Fix process list tests on windows py3
  - 316ec78 Allow more time for slow test
  - 9baf86f Do not remove attributes from process class

- e7b6aa8 Clean up cruft
- ed7103a Attempt to fix integration.shell.test\_call test
- 659c805 Change noise log to debug
- 0660b1a Clean up typos
- 9f1fe42 Call os.fork less to avoid race conditions
- **ISSUE #50814:** (doesitblend) Minion continues trying down master (refs: #54239, #53417)
- **ISSUE #49680:** (doesitblend) Beacon events handled differently than event.send (refs: #53344, #54239)
- **ISSUE #49663:** (doesitblend) Beacon only fires to single random master in HA mode (refs: #53344, #54239)
- **PR #54247:** (DmitryKuzmenko) 2019.2.1 with multimaster bb fixes @ 2019-08-23 20:19:19 UTC
  - **PR #54239:** (DmitryKuzmenko) Multimaster tests with bb fixes (refs: #54247)
  - **PR #53848:** (DmitryKuzmenko) Features/multimaster tests (refs: #54239)
  - **PR #53417:** (DmitryKuzmenko) Multimaster minion hang on fire\_master (refs: #54239, #53848)
  - **PR #53344:** (DmitryKuzmenko) Run beacons on the only one minion instance. Return to all masters. (refs: #54239, #53848)
  - 531f3aa Merge pull request #54247 from DSRCorporation/2019.2.1\_with\_multimaster\_bb\_fixes
  - 62cd8cd Merge branch '2019.2.1' into 2019.2.1\_with\_multimaster\_bb\_fixes
- **PR #54235:** (github-abcde) Fix 46034 2019.2.1 @ 2019-08-22 22:32:09 UTC
  - 993c341 Merge pull request #54235 from ogd-software/fix\_46034-2019.2.1
  - 93bd30d Add alternative fix for "!" stomping Apparently (after watching Jenkins tests fail), what yamll.safe\_load returns depends not on the version of salt, but on some other external dependency. Because of this, fix both possible return values.
  - c95dd4d Add test for this specific bugfix
  - efc29d8 Prevent yamlify\_arg from stomping "!"
- **PR #54282:** (Akm0d) clean up renamed instances in the teardown @ 2019-08-22 22:13:51 UTC
  - 5d1a4d0 Merge pull request #54282 from Akm0d/clean-up-renamed
  - 11c1117 Removed redundant parenthesis
  - 802235d don't delete shutting down ec2 instances
  - 3602942 reversed the order in which an instance was renamed
  - 5500ede renamed \_alt\_name function
  - 23beab4 clean up renamed instances in the teardown
- **PR #54252:** (s0undt3ch) [2019.2.1] More control on spun test deamons on git pillar tests @ 2019-08-22 22:13:08 UTC
  - c181f5a Merge pull request #54252 from s0undt3ch/hotfix/git-pillar-2019.2.1
  - 4eb85fa Skip tests on RHEL family < 7
  - 64a1be8 Don't even go through the transport to get the system grains
  - d0f8efa Don't keep recreating the git repos. Restore from backup.
  - 6114e9d All prep work is done in setUpClass.

- 5b030dd Daemons are now started/stopped on tests, not by salt
- ed60f0d We don't actually need grains
- 911446d Lock `uwsgi` requirement.
  - \* 805f0ac Merge branch '2019.2.1' into 2019.2.1\_with\_multimaster\_bb\_fixes

- 308ba55 Merge pull request #54266 from Akm0d/cloud\_test\_ultimate\_fix
- ff2125a Invert assertion to test for instance gone
- 82136a8 test for ec2 instance shutting down
- 283f631 run cloud -query if delete string is not available
- 33e6b6d changed deprecated assertEquals
- 41e6bc8 Cloud tests run correctly everywhere
- 03a8b2c reverted literal\_eval
- **PR #54251:** (Akm0d) reduced query calls to salt-cloud @ 2019-08-20 20:10:59 UTC
  - 25d0b52 Merge pull request #54251 from Akm0d/cloud\_test\_optimization
  - 5fe6bfc Optimized salt-cloud queries
  - 43418a4 Merge pull request #7 from Ch3LL/cloud\_provider\_files
    - \* b93944b Remove joyent config cloud test files
    - \* bd37849 Rename provider azure-config to azurearm-config
  - e7c06cb Added longer delays for ec2 tests
  - 5ceb47e Correctly check for GCE and EC2 deletion
  - 52c178c Added pretty yaml formatting to cloud-test logs
  - 4fc5e9e re-fixed simultaneous GCE tests
  - 326e9f2 Merge pull request #6 from Ch3LL/cloud\_provider\_files
    - \* adb1464 fix pylint
    - \* 51ce819 Move provider config setup into Setup/Teardown class
  - e58b40a Merge pull request #5 from Ch3LL/cloud\_provider\_files
    - \* ab8adcc Only use the provider conf.d file we are testing
  - 76609ad Merge branch '2019.2.1' into cloud\_test\_optimization
  - f764bc0 Clean up expensive queries
  - b3d02df reduced query calls to salt-cloud
- **PR #54240:** (Ch3LL) Fix TypeError python3 in get\_image\_id ec2 cloud @ 2019-08-20 20:10:01 UTC
  - ba81ca3 Merge pull request #54240 from Ch3LL/get\_image\_ec2
  - a3a39f3 Use ami variable instead in test
  - dc1ae52 Fix TypeError python3 in get\_image\_id
    - \* d6ad475 Merge branch '2019.2.1' into 2019.2.1\_with\_multimaster\_bb\_fixes
- **PR #54246:** (dwoz) Cut down on log noise @ 2019-08-19 17:20:03 UTC
  - 8404ec2 Merge pull request #54246 from dwoz/log\_noise
  - e572711 Cut down on log noise
- **PR #54245:** (dwoz) Fix the sshd pid file @ 2019-08-19 17:19:32 UTC
  - 5b3e925 Merge pull request #54245 from dwoz/sshd\_pid\_file
  - df95347 Fix the sshd pid file

- **PR #54237:** (dwoz) Do not dup2 things without fileno @ 2019-08-18 17:13:29 UTC
  - 268803b Merge pull request #54237 from dwoz/dup2
  - 2ebd22b Fix linter
  - 63c616a Do not dup2 things without fileno
    - \* 0b33498 Workaround for beacons.list\_available slowness.
    - \* b7a1058 Minor: Better support of named multimaster tests.
    - \* a5cccdf Minor: remove unneeded logging
    - \* 314bbb3 Support tcp transport in multimaster tests. Minor beacon update.
    - \* fcb8ff0 Properly set HAS\_IPTABLES from \_\_virtual\_\_ return.
    - \* a75db01 Multimaster related fixup: don't run test engine on minions
    - \* 8a88542 Multimaster beacons fix: put list into a dict to fire on the bus
    - \* 790fb41 Inotify beacons test logging and cleanup update
    - \* d84c8851 Inotify beacon test fixes and improvements.
    - \* 472ffc0 Give minion more time to handle beacon creation.
    - \* 17ceee0 Fixed Lint errors
    - \* 0bcf53c Fixed the unicode and timing inotify test issues.
    - \* f17bcf3 Improved assertion error diagnostic for master down test.
    - \* db0bae8 Run multimaster as well tests when no specific group is set
    - \* 723f363 Ignore the multimaster minion subgroup test in module names test.
    - \* 612191c Fixed lint failures
    - \* c1efae6 Multimaster test for events handling on master disconnect
    - \* 1654fe8 Multimaster inotify beacons test
    - \* 65dc47c Multimaster tests environment and test module test.
    - \* 2c178b0 Moved annoying message to trace log level.
    - \* 3e497c1 Handle minion events asynchronously.
    - \* 909323a Tests fixes
    - \* 6dad18f Cleanup event object
    - \* 2bf55be Run beacons on the only one minion instance. Return to all masters.
- **PR #54121:** (Akm0d) Refactored cloud tests @ 2019-08-16 17:24:14 UTC
  - 27d89bd Merge pull request #54121 from Akm0d/gce\_cloud\_test
  - 48c57b3 Try multiple times to detect deletion of an instance
  - 74300eb return a valid set
  - 2d63b87 Wait for an instance to be fully created if necessary
  - 83ad8b3 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce\_cloud\_test
- **ISSUE #54174:** (dwoz) SignalHandlingMultiprocessingProcess bugs (refs: #54204)
- **PR #54204:** (dwoz) Fix signal handling in subprocesses @ 2019-08-16 00:46:40 UTC

- **PR #54223:** (dwoz) Test verify logs without a whole minion @ 2019-08-16 00:46:09 UTC
  - 99a8fc5 Merge pull request #54223 from dwoz/7754\_test\_removal
  - 4be711e Fix up linter warts
  - 7573826 Remove crufty un-needed tests
  - effa77d Test verify logs without a whole minion
    - \* b40f41f Revert fallback to default signals change
    - \* 1d83b10 Fix signal handling in subprocesses
      - f90fe66 Reverted foo/bar creds per #46265
      - 3f56bad Reduced the amount of informtaion in debuggings tatements
      - de53bf0 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce\_cloud\_test
- **PR #54203:** (dwoz) Run transport test loops in single thread @ 2019-08-15 20:10:20 UTC
  - 8d440e0 Merge pull request #54203 from dwoz/transport\_tests
  - 22b9d38 Run transsport test loops in single thread
    - \* f6180a6 Even better logging of errors
    - \* a15dc4b better formatting and error reporting
    - \* 51fbc2a better logging on instance create failure
    - \* 1f7dd52 removed hack fixes from gce
    - \* 31cdc7c WAR ROOM SKIP GCE TESTS
    - \* 7d603be hasattr cannot find parent properties starting with \_\_
    - \* 686cab9 Separated assertInstanceDestroy and \_destry\_instance
    - \* 158a38c Revert "Removed subclass from cloud name"
    - \* b7cf43d Removed subclass from cloud name
    - \* 8c5eb18 fixed pylint error on format string
    - \* 59e20bc Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- **PR #54191:** (garethgreenaway) [2019.2.1] Addition logging in testprogram used by integration.shell.test\_minion.MinionTest.test\_exit\_status\_correct\_usage @ 2019-08-13 21:44:41 UTC
  - a05018e Merge pull request #54191 from garethgreenaway/test\_program\_test\_mininion
  - 8463f84 Adding some additional logging when the call to "proc\_cmdline = proc.cmdline()" results in a AccessDenied exception, so we can see what the process is and who the process is running as.
- **PR #54202:** (waynew) Only run one filter test @ 2019-08-13 21:33:32 UTC
  - e5e9299 Merge pull request #54202 from waynew/shorter-jinja-ssh-tests
  - c333ac8 Only run one filter test
    - \* 5912f24 Switched to Azurearm over msazure
- **PR #54172:** (Ch3LL) Migrate from azure to azurearm tests @ 2019-08-13 20:07:34 UTC

- a13cb3e Merge pull request #54172 from Ch3LL/azurearm\_tests
- 465523f Migrate from azure to azurearm tests
- ISSUE #50535: (wyardley) salt errors with current azure-storage because of no version set (refs: #50567)
- PR #54173: (Ch3LL) Cherry Pick #50567 and #53238 into 2019.2.1 @ 2019-08-13 20:07:09 UTC
  - PR #53238: (nicholasmhughes) Azure: Fixed ability to pass SSH key to Linux VMs (refs: #54173)
  - PR #50567: (rombert) azurefs: gracefully handle AttributeError (refs: #54173)
  - 39d0c59 Merge pull request #54173 from Ch3LL/azure\_fixes
  - 9052eaf reverting log string handling
  - a1a61ee fixed ability to pass ssh key to Linux VMs
  - 4a141a1 azurefs: gracefully handle AttributeError
    - \* 6fa28de fixed underscore
      - c35379a Moved finding installer into class
    - \* 95484f8 Moved finding installer into class
    - \* a86ae34 moved installer finder to SetUp method
    - \* 933964a removed default user/pass from profitbricks test file
    - \* 2a2437d fixed dictionary access
    - \* b9ee411 Fixed broken tests
    - \* 80efd26 fixed misspelled provider information
    - \* 511779b removed unused imports
    - \* 1cd1c13 setUp all cloud tests the same way
    - \* d322408 Got rid of unnecessary delay
    - \* 98ba18c fixed pylint error
    - \* c34c17e Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- PR #54178: (dwoz) Fix flaky set\_computer\_name in mac\_system module @ 2019-08-12 18:26:40 UTC
  - 19f4d5e Merge pull request #54178 from dwoz/mac\_computer\_name
  - e51100e Fix skip on non macos platforms
  - a3a9d92 Fix linter
  - c499d44 Revert unwanted flaky from non computer name tests
  - 941fcc8 Fix flaky set\_computer\_name in mac\_system module
    - \* 90e8350 Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- PR #54180: (dwoz) Point test-kitchen to my keepalive\_maxcount branch @ 2019-08-12 18:18:26 UTC
  - 6fe6799 Merge pull request #54180 from dwoz/keepalive\_maxcount
  - dc9ee21 Add reminder about kitchen version
  - 19a1f1b Point test-kitchen to my keepalive\_maxcount branch
    - \* 60f8351 Fixed failing Ec2 Tests
    - \* e2f085c removed py3-only function call

- \* 4406c57 fixed lint errors, more descriptive fails
- \* 6840d5f assert instances exist in unified way
- \* 03da233 skip EOL joyent tests, secure delete instances
- \* 3123bb1 Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- **ISSUE #53306:** (doesitblend) Fully Qualify CMD on Windows Minions (refs: #53311, #54033)
- **PR #54033:** (twangboy) Backport #53311 to 2019.2.1 @ 2019-08-09 16:46:36 UTC
  - **PR #53311:** (doesitblend) Add fully qualified cmd call (refs: #54033)
  - 9f5302d Merge pull request #54033 from twangboy/fix\_win\_service\_2019.2.1
  - 2850fab Merge branch '2019.2.1' into fix\_win\_service\_2019.2.1

  - c0e49d9 Merge pull request #53900 from twangboy/fix\_lgpo
  - e05abdf Merge branch '2019.2.1' into fix\_lgpo
  - e4e71cd Remove duplicate test
  - 68c632b Add some tests
  - 3c34075 Fall back to slower method if new method not available
  - 0108bcd Avoid using the lowercase method in XPath
  - fcc0405 Fix telemetry issue, add some timing logs
- **PR #52818:** (twangboy) Add watchdog as a bundled dependency on Windows @ 2019-08-09 04:26:54 UTC
  - 9eb2938 Merge pull request #52818 from twangboy/add\_watchdog
  - 2658634 pre-commit
  - 35691f2 Add watchdog to Linux and OSX .in files
  - 5ef5969 Rremove opensuse 42 static files
  - ec285d0 Remove watchdog from the rest of the .in files
  - 86e64ae Remove unused import, remove Windows reference
  - b934d53 Remove watchdog from windows.in
  - cfaee96 Fix and unify watchdog beacon tests for all OS's
  - cc73204 Put Windows tests in their own class
  - 6fbf1a3 Remove unused import... lint
  - 832a1db Fix windowsisms
  - 4f47d50 Update static requirements
  - 762fe3b Remove some fluff
  - 946076c Add watchdog for tests
  - 02248dc Fix modified test to account for OS variances
  - 15ee479 Compile static requirements

- 78a5723 Add watchdog to Linux and OSX .in files
- 9a0f08a Update static requirements
- 5cad13b Remove opensuse 42 static files
- 1f05fce Remove watchdog from the rest of the .in files
- 121595a Remove unused import, remove Windows reference
- c410a4b Remove watchdog from windows.in
- 05a0845 Fix and unify watchdog beacon tests for all OS's
- 200e230 Put Windows tests in their own class
- 6cc8d96 Remove unused import... lint
- a4abb72 Fix windowsisms
- 005bed9 Update static requirements
- c1bc627 Remove some fluff
- 92c8d47 Add watchdog for tests
- 9544624 Add watchdog as a bundled dependency on Windows
- **PR #54143:** (Akm0d) Don't call potentially missing shade library (#53734) @ 2019-08-09 01:05:26 UTC
  - **PR #53734:** (Akm0d) Don't call potentially missing shade library (refs: #54143)
  - 5bef520 Merge pull request #54143 from Akm0d/openstack\_fix
  - 3f58885 Merge branch '2019.2.1' into openstack\_fix
  - 71f5f38 Don't call potentially missing shade library (#53734)
    - \* 29ee7ce removed print statements, optimized query
    - \* 14b7539 added back print statements for easy debug
    - \* 823b3b2 Removed print statements and broken re
    - \* 9696ed9 experiment with subclass names
    - \* 2fa6157 more verbose instance names based on test
    - \* 2acb2df undercased non-const variable and added print statements
    - \* c5e875d Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- **PR #54001:** (garethgreenaway) [2019.2.1] Porting metaproxy changes in #50183 to 2019.2.1 @ 2019-08-08 04:24:31 UTC
  - **PR #50183:** (cro) Allow proxy minion types to be dynamically loaded (refs: #54001)
  - 584e3f2 Merge pull request #54001 from garethgreenaway/add\_metaproxy\_2019\_2\_1
  - 8353467 Merge branch 'add\_metaproxy\_2019\_2\_1' of github.com:garethgreenaway/salt into add\_metaproxy\_2019\_2\_1
    - \* 1892d86 Merge branch '2019.2.1' into add\_metaproxy\_2019\_2\_1
  - ab72e1b Adding unit.test\_proxy\_minion to ignore list
  - 09f6fed Removing match tests, functionality does not exist in 2019.2.1
  - 4af95e4 Adding tests to ensure \_metaproxy\_call to called when ProxyMinion objects are created.
  - d162a88 Adding salt/metaproxy/proxy.py and tests/unit/modules/test\_match.py

- 51726b1 Porting metaproxy changes in #50183 to 2019.2.1
- **ISSUE #51008:** (cdalvaro) cwd option not working with cmd.run and runas (refs: #52632, #54079)
- **PR #54136:** (ScoreUnder) Fix cmd.run on MacOS (rebased) @ 2019-08-08 04:20:31 UTC
  - **PR #54079:** (ScoreUnder) Fix cmd.run on MacOS – wrong environment variables (refs: #54136)
  - **PR #52632:** (cdalvaro) Prevent shell injection as root with cmd.run on macOS (refs: #54079)
  - **PR #47212:** (weswhet) fix macOS running as user. (refs: #54079)
  - bf863d0 Merge pull request #54136 from ScoreUnder/2019.2.1-patch-macos-cmd.run
  - 1182eb9 Add integration test justifying strange use of braces after cd in cmd.run
  - 733d2e7 Fixes to ITs
  - da38993 Add integration tests for cwd/runas changes on MacOS
  - ab8b39c Fix environment in cmd.run runas on MacOS
    - \* c9cb18f Don't call potentially missing shade library (#53734)
    - \* 5ef8414 Added more verbose logging to cloud tests
    - \* 2f3942f better logging and fail messages
    - \* 9454f4c Fixed pylint errors and temporary print statements
    - \* fd13ce1 Further refactored cloud test code
    - \* b03cc48 Assume the instance exists and needs to be deleted
    - \* 0991ff5 fixed pylint errors and failed tests
    - \* 55e502a Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into gce\_cloud\_test
- **PR #53974:** (Ch3LL) [2019.2.1] Add pygit2 requirement @ 2019-08-06 17:32:05 UTC
  - e268b95 Merge pull request #53974 from Ch3LL/add\_pygit2
  - 11864a0 Merge branch '2019.2.1' into add\_pygit2
  - d1b1452 Merge branch '2019.2.1' into add\_pygit2
  - a5698cc Merge branch '2019.2.1' into add\_pygit2
  - 7dd97a6 Merge branch '2019.2.1' into add\_pygit2
  - 358974a Skip Pygit2 tests on windows
  - bc64961 Use accurate file:/// URI on windows for gitfs tests
  - 894f958 Fix GitFS support for pygit2 >= 0.28.0
  - 4580030 [2019.2.1] Add pygit2 requirement
    - \* 4009bb5 fixed pylint errors
    - \* 459b16d put cloudtest base in separate file so that only one change needs to be made
    - \* 8e72335 Merge branch 'gce\_cloud\_test' of github.com:Akm0d/salt into gce\_cloud\_test
      - 0e2621e Merge branch '2019.2.1' into gce\_cloud\_test
    - \* 9f98b16 finished merge
- **PR #54108:** (dwoz) More robust azure instance deletion @ 2019-08-03 03:58:20 UTC
  - 46f5e2e Merge pull request #54108 from dwoz/azure\_test

- 754b719 Fix linter
- 773235d Fix missing time import
- 5a8f2ec More robust azure instance deletion
- **PR #54017:** ([dmurphy18](#)) Allow for main thread having terminated pid, before ThreadPoolExecutor threads @ 2019-08-02 18:11:48 UTC
  - 2cb5a0b Merge pull request #54017 from dmurphy18/fix\_deb9\_build90\_tests
  - 2866520 Skip process kill tests on Windows
  - 5577f14 Clean up lint errors
  - 4ca709e Merge branch '2019.2.1' into fix\_deb9\_build90\_tests
  - 264c767 Merge pull request #1 from dwoz/fix\_deb9\_build90\_tests
    - \* 9bb9466 Add unit tests for weird pid does not exist cases
    - \* 64d9752 Add warning messages to help determine why pids do not exist
  - 406d382 Adjusted for review comments
  - 2d20fbe Adjusted try/except statements on process checking
  - e189177 Removed typos
  - 2e3ca43 Updated for review comments
  - 68c29af Allow for main thread having terminated pid, before ThreadPoolExecutor threads
    - \* e3158c8 refactored all cloud tests
    - \* 194e0c7 Refactored GCE cloud test
- **PR #54080:** ([dmurphy18](#)) Disabling random website tests till allow for quota usage @ 2019-07-31 21:16:54 UTC
  - 4e2efcd Merge pull request #54080 from dmurphy18/u1804\_py3\_random\_skip
  - 0660e6e Disabling random website tests till allow for quota usage
- **PR #54063:** ([twangboy](#)) Make the skip apply to any system missing crypt @ 2019-07-30 19:22:07 UTC
  - dbbbcc9 Merge pull request #54063 from twangboy/fix\_test\_pycrypto\_2019.2.1
  - 6fcf035 Make the skip apply to any system missing crypt
- **PR #54050:** ([cmcmarrow](#)) fixes integration terminate error @ 2019-07-30 13:38:55 UTC
  - 4df6271 Merge pull request #54050 from cmcmarrow/integration\_terminate\_fix
  - ebb07f4 Merge branch '2019.2.1' into integration\_terminate\_fix
- **PR #54057:** ([dmurphy18](#)) Added support for is\_fedora and skip Minion test test\_issue\_7754 on Fedora @ 2019-07-29 22:41:25 UTC
  - 9d1bd63 Merge pull request #54057 from dmurphy18/fix\_fedora30\_test
  - 30f3bda Added support for is\_fedora and skip Minion test test\_issue\_7754
  - b3293a9 Merge branch '2019.2.1' into integration\_terminate\_fix
- **ISSUE #53948:** ([KChandrashekhar](#)) integration.shell.test\_call.CallTest.test\_issue\_2731\_masterless (refs: #54040)
- **ISSUE #2731:** ([cwood](#)) Masterless Broken in 0.10.5 (refs: #54040)
- **PR #54040:** ([waynew](#)) Remove dead test @ 2019-07-29 17:23:45 UTC

- 5d3bcd7 Merge pull request #54040 from waynew/remove-dead-test
- e9a5a57 Remove dead test
  - \* ba3e867 Merge branch '2019.2.1' into integration\_terminate\_fix
- PR #54051: (twangboy) Skip get time test @ 2019-07-29 16:54:50 UTC
  - 70ffcec Merge pull request #54051 from twangboy/fix\_test\_system
  - ceaba05 Skip get time test
- PR #54038: (Ch3LL) Python3 digital ocean test fix: to\_str on key @ 2019-07-29 16:54:19 UTC
  - 4aed833 Merge pull request #54038 from Ch3LL/do\_py3\_fix
  - f7346db Python3 digital ocean test fix: to\_str on key
    - \* 05cd93f fixes integration terminate error
    - \* 69c3106 fixes integration terminate error
- PR #53735: (twangboy) Fix Windows tests in test\_system @ 2019-07-26 22:38:28 UTC
  - 3cedacd Merge pull request #53735 from twangboy/fix\_test\_system
  - a9e9c97 Add timeouts and account for those in assert
  - d3a160e Merge branch '2019.2.1' into fix\_test\_system
  - f95f0e7 Merge branch '2019.2.1' into fix\_test\_system
  - 87e02b8 Use setUpClass
  - 6a685bd Fix some tests in the Windows Class
- PR #53953: (Ch3LL) Send SIGTERM to webserver in teardown of gitfs tests @ 2019-07-25 21:12:42 UTC
  - cc1cda1 Merge pull request #53953 from Ch3LL/improve\_git\_test
  - 347ea1e Use Sigkill and add time.sleep before check
  - 637bf95 Merge branch '2019.2.1' into improve\_git\_test
  - c0be147 Send SIGTERM webserver during teardown of gitfs tests
  - b776c0c Check if gitfs server fails to setup for tests
- PR #53999: (Ch3LL) Generate new key each time for digital ocean key test @ 2019-07-25 21:07:45 UTC
  - 2324167 Merge pull request #53999 from Ch3LL/fix\_digital\_ocean
  - b0b6e3b Generate new key each time for digital ocean key test
- PR #53970: (garethgreenaway) [2019.2.1] Adding a WAR ROOM Skip for test\_directory\_clean\_require\_with\_name @ 2019-07-25 21:03:49 UTC
  - 32fec66 Merge pull request #53970 from garethgreenaway/osx\_skip\_test\_directory\_clean\_require\_with\_name
  - 362b84a Adding a WAR ROOM Skip for test\_directory\_clean\_require\_with\_name
- PR #54003: (dwoz) War room skip for tcp build @ 2019-07-24 22:52:18 UTC
  - 213dfff Merge pull request #54003 from dwoz/skip\_test
  - 6cdb8fa War room skip for tcp build
- PR #53897: (cmcmarrow) patches salt grains locale\_info decode error @ 2019-07-23 13:19:00 UTC
  - 048c097 Merge pull request #53897 from cmcmarrow/timezone\_fix

- d9e402d Merge branch '2019.2.1' into timezone\_fix
- **PR #53920:** (s0undt3ch) [2019.2.1] Update CI pipelines. Remove old jenkins cruft. @ 2019-07-20 12:33:01 UTC
  - 9a846b4 Merge pull request #53920 from s0undt3ch/hotfix/ci-pipelines-2019.2.1
  - b09963b Update CI pipelines. Remove old jenkins cruft.
- **PR #53728:** (garethgreenaway) [2019.2.1] Disabling test\_get\_set\_computer\_name on OS X and Py3 @ 2019-07-19 17:18:33 UTC
  - 15accefc Merge pull request #53728 from garethgreenaway/2019\_2\_1\_mac\_system\_disable\_test\_get\_set\_computer\_name
  - a6d853c Merge branch '2019.2.1' into 2019\_2\_1\_mac\_system\_disable\_test\_get\_set\_computer\_name
  - 5d537ed Missing six import. Updating skip message.
  - ac6dccd Disabling test\_get\_set\_computer\_name on OS X and Py3.
- **PR #53913:** (garethgreenaway) [2019.2.1] skip test\_issue\_2594\_non\_invalidated\_cache on MacOS @ 2019-07-19 17:17:36 UTC
  - a54ec89 Merge pull request #53913 from garethgreenaway/disable\_test\_issue\_2594\_non\_invalidated\_cache\_macos
  - c65c5d5 Skip the test test\_issue\_2594\_non\_invalidated\_cache on MacOS where it is flakey.
- **PR #53902:** (twangboy) Skip tests that modify date or time @ 2019-07-18 17:53:31 UTC
  - b091eb7 Merge pull request #53902 from twangboy/skip\_dt
  - 76cf936 Skip tests that modify date or time
- **PR #53901:** (s0undt3ch) [2019.2.1] Don't fail when combining coverage files @ 2019-07-18 17:46:32 UTC
  - 22b7b1a Merge pull request #53901 from s0undt3ch/hotfix/wrap-coverage-combine
  - b459a48 Don't fail when combining coverage files
- **PR #53542:** (dwoz) Fix leak of SaltMessageClient instances when using tcp transport @ 2019-07-18 17:44:44 UTC
  - 84e798a Merge pull request #53542 from dwoz/tcp\_leak
  - 3daeb4f Update TCP pipelines
  - 52f9556 Merge branch '2019.2.1' into tcp\_leak
  - f5313fd Fix tcp message client test
  - 3419bf5 Merge branch '2019.2.1' into tcp\_leak
  - 3125cd3 Merge branch '2019.2.1' into tcp\_leak
  - 9a33582 Merge branch '2019.2.1' into tcp\_leak
  - 7eb5d41 Merge branch '2019.2.1' into tcp\_leak
  - 481372b Fix torando loop thread issue
  - aff15d4 Fix linter wart
  - 9606db7 Comment the tcp message client test better
  - dcf576f Add unit test for tcp message client close method
  - 4420556 Download artifacts for tcp jobs
  - e6a09dd Merge remote-tracking branch 'origin/tcp\_leak' into tcp\_leak
    - \* f484f3f Merge branch '2019.2.1' into tcp\_leak

- 4a37234 Add tcp suffix to github notifications
- 4a2848b Add transport PR tests
- 9a4b407 Fix leak of SaltMessageClient instances when using tcp transport
  - \* 592f3fe undo test
  - \* bc550ad wip pytest test david
  - \* 75571e4 fixes timezone decode error
  - \* d041660 fixes timezone decode error
  - \* 1ddd1a9 fixes timezone decode error
  - \* e75dafa patches timezone grain
  - \* eaca473 patches salt grains locale\_info decode error
- **PR #53873:** (bryceml) increase sleep time between kitchen create failures to account for ap... @ 2019-07-16 23:46:09 UTC
  - 61e9efd Merge pull request #53873 from bryceml/2019.2.1-increase-sleep
  - aae0bf6 increase sleep time between kitchen create failures to account for api limits
- **PR #53750:** (twangboy) Fix memory error when the test suite cleans up (2019.2.1) @ 2019-07-16 23:00:07 UTC
  - 317d9af Merge pull request #53750 from twangboy/fix\_helpers
  - fa0e9c3 Merge branch '2019.2.1' into fix\_helpers
- **PR #53851:** (dwoz) Master stats revert @ 2019-07-16 16:05:38 UTC
  - 6c2b3a5 Merge pull request #53851 from dwoz/master\_stats\_revert
  - 0bc72e4 Revert "Merge pull request #53822 from dwoz/master\_stats\_test"
  - 4553ba7 Revert "Merge pull request #53829 from saltstack/fix\_stats\_2019.2.1"
- **PR #53829:** (dwoz) Fix stats on windows @ 2019-07-12 01:03:47 UTC
  - 5064027 Merge pull request #53829 from saltstack/fix\_stats\_2019.2.1
  - 9f2d20d Fix stats on windows
- **PR #53826:** (dmurphy18) WAR ROOM test skip till rewritten to allow for dnf on RHEL 8 and F30 @ 2019-07-12 00:39:11 UTC
  - 971eda3 Merge pull request #53826 from dmurphy18/fedora30\_fixes
  - 34b261d WAR ROOM test skip till rewritten to allow for dnf on RHEL 8 and Fedora 30
- **PR #53822:** (dwoz) Enable master stats for tests @ 2019-07-11 23:37:55 UTC
  - ba33d76 Merge pull request #53822 from dwoz/master\_stats\_test
  - d2b8315 Enable master stats for tests
  - 3471422 Fix memory error when the test suite cleans up
- **PR #53591:** (twangboy) Fix whitelist errors in `test_boto_*` state tests on Windows @ 2019-07-07 05:45:21 UTC
  - 1756156 Merge pull request #53591 from twangboy/fix\_boto\_tests
  - ba8ba26 Merge branch '2019.2.1' into fix\_boto\_tests

  - ee59d39 Merge branch '2019.2.1' into nodegroup\_group\_list
  - d236bd4 Allow yaml list notation for nodegroup expansion
- **PR #53562:** (Ch3LL) Move create key call into try/except in Digital Ocean key test @ 2019-07-02 16:08:08 UTC
  - 8857dbd Merge pull request #53562 from Ch3LL/do\_key\_test
  - 315eb35 Merge branch '2019.2.1' into do\_key\_test
  - 75ac708 Merge branch '2019.2.1' into do\_key\_test
  - 128ba07 Move create key call into try/except in Digital Ocean key test
    - \* 22d4a3a Merge branch '2019.2.1' into fix\_pywin32\_2019.2.1
    - \* 6bb6df7 Merge branch '2019.2.1' into fix\_pywin32\_2019.2.1
    - \* 534c984 Merge branch '2019.2.1' into fix\_pywin32\_2019.2.1
    - \* 382c637 Merge branch '2019.2.1' into fix\_pywin32\_2019.2.1
    - \* fb4090d update py3 script
    - \* 0ea70ba Don't remove pythonwin directory

- ba37276 Use string\_types instead of text\_types
- f6d0084 Add some unit tests, raise error on non-string types
- 35ed8be Create function for encoding string values
- c4c1082 Return encoded null when string value is None
- **PR #53627:** (dmurphy18) Cherry pick pr 53370 from 2018.3 into 2019.2.1 @ 2019-06-28 19:54:13 UTC
  - 164aaeb Merge pull request #53627 from dmurphy18/cherry-pick-pr-53370
  - 450d23d Merge branch '2019.2.1' into cherry-pick-pr-53370
- **ISSUE #53411:** (cro) Events can grow stale when event\_listen\_queue is set. (refs: #53587, #53412)
- **PR #53587:** (cro) Forward port from 2018.3 Add event\_listen\_queue\_max\_seconds to fix #53411 @ 2019-06-28 16:49:46 UTC
  - **PR #53412:** (cro) Stale events 53411 (refs: #53587)
  - 6559e4c Merge pull request #53587 from cro/53412-2019.2.1
  - 9e69bd4 Merge branch '2019.2.1' into 53412-2019.2.1
  - 949a026 Merge branch '2019.2.1' into 53412-2019.2.1
  - f5d81c9 Merge branch '2019.2.1' into 53412-2019.2.1
  - d74c313 Merge branch '2019.2.1' into 53412-2019.2.1
  - b3c3f52 Make doc build test pass.
  - 8001130 Add event\_listen\_queue\_max\_seconds to fix #53411
    - \* 34e38d7 Merge branch '2019.2.1' into cherry-pick-pr-53370
- **ISSUE #53283:** (Ch3LL) integration.states.test\_file.FileTest.test\_directory\_broken\_symlink (refs: #53295)
- **PR #53295:** (DmitryKuzmenko) Recurse kwarg of state.directory state shall be a list or None @ 2019-06-27 23:20:10 UTC
  - 14efced Merge pull request #53295 from DSRCorporation/bugs/test\_file\_recurse\_set
  - 2927b78 Merge branch '2019.2.1' into bugs/test\_file\_recurse\_set
  - 9c01670 Merge branch '2019.2.1' into bugs/test\_file\_recurse\_set
  - 571d82a Merge branch '2019.2.1' into bugs/test\_file\_recurse\_set
  - ee8f0e3 Merge branch '2019.2.1' into bugs/test\_file\_recurse\_set
  - 013e04c Recurse kwarg of state.directory state shall be a list of None
- **ISSUE #52926:** (waynew) integration.states.test\_beacon.BeaconStateTestCase.test\_present\_absent - Beacon "diskusage" is not available (refs: #53493, #53466)
- **ISSUE #52245:** (twangboy) integration.states.test\_beacon.BeaconStateTestCase.test\_present\_absent (refs: #53493, #53466)
- **PR #53466:** (dwoz) More robust beacon state test @ 2019-06-27 23:17:01 UTC
  - 75175bb Merge pull request #53466 from dwoz/test\_pres\_abs
  - f24bf06 Use new pipeline format
  - a74580b Clean up cruft
  - 68958f5 Do not create duplicate minion ids

- c47eeb4 Add amazon 2 to PR tests
- dc90b47 More robust beacon state test
  - \* 95b1819 Initial working tests for gpg fixes and import keys, signing
  - \* b2c9ae2 Update access to str/bytes with to\_unicode/to\_bytes for Python 3
- **PR #53609:** (s0undt3ch) CI Pipelines. Timeout after getting a node. Report exit code. @ 2019-06-27 16:09:54 UTC
  - 582ac5f Merge pull request #53609 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 024be84 CI Pipelines. Timeout after getting a node. Report exit code.
- **PR #53574:** (s0undt3ch) [2019.2.1] Minor fixes/adjustments to the new CI pipelines @ 2019-06-25 18:48:25 UTC
  - f568796 Merge pull request #53574 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - e85e2f4 Minor fixes/adjustments to the new CI pipelines
- **PR #53584:** (dwoz) Add unit tests for recent SaltCacheLoader changes @ 2019-06-24 23:40:43 UTC
  - **PR #53563:** (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584)
  - 77b7fc4 Merge pull request #53584 from dwoz/client\_cache
  - e9b61dc Add unit tests for recent SaltCacheLoader changes
    - \* 5558a0a Add reg to the whitelist
- **PR #53563:** (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584) @ 2019-06-22 23:23:03 UTC
  - 6ed6c31 Merge pull request #53563 from twangboy/py3\_windows\_hang
  - 369720e Allow the file\_client to be overridden
  - f6c592c Don't instantiate the file\_client every time
- **PR #53432:** (garethgreenaway) [2019.2.1] Various fixes for 2019.2.1 to ensure tests pass on Mac OS X @ 2019-06-21 13:47:41 UTC
  - c606952 Merge pull request #53432 from garethgreenaway/2019\_2\_1\_mac\_fixes
  - 1974f11 Disabling a couple more tests in integration.modules.test\_cp that hang on OS X and Py2.
  - 7721151 Fixing lint.
  - 1d4e228 Updating various skips for tests to only skip if OS is OS X and Python is Python2.
  - 01dafdc Skipping integration.modules.test\_cp.CPModuleTest.test\_get\_file\_str\_https on OS X
  - c02db20 Disabling integration.modules.test\_state.StateModuleTest.test\_parallel\_state\_with\_long\_tag
  - 8788877 Skip integration.states.test\_file.FileTest.test\_issue\_11003\_immutable\_lazy\_proxy\_sum and integration.states.test\_pip\_state.PipStateTest.test\_22359\_pip\_installed\_unless\_does\_not\_trigger\_warnings when running on OS X.
  - cf76027 Removing wrong import of skipIf
  - b10e1e7 Moving the skipIf for OS X from the beacon state tests to the renderer state tests.
  - d2fef9a Disabling beacon state tests on OS X for the time being.
  - 1741bb0 Adding some timeouts to see if it helps the tests pass on OS X.
  - fd0ba0a Ensure the user and group used by @with\_system\_user\_and\_group are consistent.
  - e03ab81 Using salt.utils.path.which to find false, on OSX it lives under /usr/bin/

- 353f9d4 Fixing the beacons.reset function. Once the reset has taken place in beacons/\_\_\_init\_\_.py we need to fire an event back to complete the loop and ensure that everything worked as expected.
- ee3cbc7 fix to how the depends decorator works. Only run the dependancy commands for the module we're checking.
- 8440176 Fixing a log issue that pops up after test\_gen\_thin\_compression\_fallback\_py3 on "OS X, need to ensure that salt.utils.thin.os.close is mocked.
- 9767ddd Format for the sqlite3 databse used for the assistive information changed in Mojave, additional columns added.
- 9c8a7e6 Fixing a bug when the roots fileserver and the location is a symlink to another location. This fix ensures that when fsroot is referenced we are using the real path and not the symlink path.
- **PR #53526:** (s0undt3ch) [2019.2.1] Update pipelines to work on old and new jenkins @ 2019-06-20 15:29:13 UTC
  - 59e2a1f Merge pull request #53526 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 24d6d09 Update pipelines to work on old and new jenkins
- **PR #53210:** (Ch3LL) Cherry-Pick #52787 into 2019.2.1 @ 2019-06-20 13:33:13 UTC
  - **PR #52787:** (garethgreenaway) [2018.3] Fixes to test\_pip state sls files (refs: #53210)
  - f5f80af Merge pull request #53210 from Ch3LL/cp-52787
  - f27c434 Merge branch '2019.2.1' into cp-52787
- **PR #53467:** (twangboy) Check valid username first (fixes failing symlink test) @ 2019-06-19 17:04:30 UTC
  - fd6cb35 Merge pull request #53467 from twangboy/fix\_test\_win\_file
  - 92950c5 Merge branch '2019.2.1' into fix\_test\_win\_file
  - 6a21edb Merge branch '2019.2.1' into fix\_test\_win\_file
  - 31ce1fb Fix some lint, skip some tests
  - 6de4db6 Monkeypatch in the class instead of globally
  - d663a1f Fix the failing BlockReplace test cases on Windows
  - 299f88f Update test\_managed\_contents
  - 81110e5 Fix test\_file\_copy\_make\_dirs that was failing on Linux
  - 8d0529d Fix some lint
  - 4a9c020 Fix issues with win\_runas
  - bceffa1 Remove privs message
  - 54be0a6 Verify username early in win\_runas
- **PR #53475:** (Ch3LL) Add pypsexec requirement for cloud tests @ 2019-06-19 13:30:25 UTC
  - 3230078 Merge pull request #53475 from Ch3LL/add\_pypsexec
  - ab59a55 Merge branch '2019.2.1' into add\_pypsexec
  - f954363 Merge branch '2019.2.1' into add\_pypsexec
  - 8f7cbfc Merge branch '2019.2.1' into add\_pypsexec
  - fa22b39 Add pypsexec requirement for cloud tests
- **PR #53491:** (Ch3LL) Update test\_gen\_hash for macosx @ 2019-06-19 13:16:04 UTC
  - bdd7c2c Merge pull request #53491 from Ch3LL/crypt\_test\_mac

- 85e96bd Merge branch '2019.2.1' into crypt\_test\_mac
- 700338e Merge branch '2019.2.1' into crypt\_test\_mac
- 4ce7fb1 Merge branch '2019.2.1' into crypt\_test\_mac
- 832ded6 Merge branch '2019.2.1' into crypt\_test\_mac
- 775b8c2 Merge branch '2019.2.1' into crypt\_test\_mac
- 0832b49 Update test\_gen\_hash for macosx
- **PR #53494:** (Ch3LL) Always delete digital ocean key for test\_key\_management test @ 2019-06-19 13:14:51 UTC
  - 8c2e952 Merge pull request #53494 from Ch3LL/do\_cloud\_test
  - 5053eab Merge branch '2019.2.1' into do\_cloud\_test
  - 64a3e8d Merge branch '2019.2.1' into do\_cloud\_test
  - 45c0c43 Merge branch '2019.2.1' into do\_cloud\_test
  - 3826c56 Allows delete digital ocean key for test\_key\_management test
    - \* 6b6dc66 Merge branch '2019.2.1' into cp-52787
- **PR #53434:** (weswhet) Update documentation for newer mac\_service module. @ 2019-06-19 01:15:19 UTC
  - 2e3778b Merge pull request #53434 from weswhet/patch-2
  - 89398a9 Update salt.modules.service.rst
  - b9c1b1a Update salt.modules.service.rst
  - a962a64 Merge branch '2019.2.1' into patch-2
- **PR #53498:** (amendlik) Fix broken documentation links @ 2019-06-18 23:44:05 UTC
  - f72ebba Merge pull request #53498 from amendlik/links
  - e360a70 Fix broken documentation links for service virtual module
  - 56f65ec Fix broken documentation links for pkg virtual module
    - \* 010a2c5 Update documentation for newer mac\_service module.
      - 1bbdc7f Merge branch '2019.2.1' into cp-52787
- **PR #53514:** (Ch3LL) Revert logging changes from #53492 @ 2019-06-18 20:49:04 UTC
  - **PR #53492:** (dwoz) Fix syndic connection when using tcp transport (refs: #53514)
  - 0793272 Merge pull request #53514 from Ch3LL/disable\_py3\_logging
  - 8c8f0ac import six runtests log handler
  - f442b33 Revert "Enable logging for test runs on py3"
    - \* b62be16 Merge branch '2019.2.1' into cp-52787
- **PR #53485:** (s0undt3ch) [2019.2.1] Workaround nox's install only flag @ 2019-06-18 09:35:34 UTC
  - 98285f9 Merge pull request #53485 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 69e1d84 Workaround nox's install only flag
    - \* 8622bba Merge branch '2019.2.1' into cp-52787
- **PR #53369:** (Akm0d) Added refs to AIX module documentation @ 2019-06-17 20:29:01 UTC
  - ff7370e Merge pull request #53369 from Akm0d/aix\_docs

  - d15c8f2 Merge branch '2019.2.1' into ami\_window\_cloud
  - 941778f Update ami's used for windows cloud tests
  - **PR saltstack/salt#53332:** (s0undt3ch) Non optional full test runs for 2019.2.1 (refs: #53431)
- **PR #53431:** (dwoz) Revert "Non optional full test runs for 2019.2.1" @ 2019-06-10 21:44:30 UTC
  - d806b58 Merge pull request #53431 from saltstack/revert-53332-hotfix/full-test-run-2019.2.1
  - 701218c Revert "Non optional full test runs for 2019.2.1"
- **ISSUE #52174:** (amendlik) file.stat function not working under Python 3 (refs: #53430)
  - **PR #53430:** (Akm0d) Cherry-pick #52174 into 2019.2.1
    - \* 7811971 Merge branch '2019.2.1' into cp-52787
- **PR #53389:** (bryceml) only keep last 10 builds of every pr on jenkins to reduce disk usage @ 2019-06-10 17:18:48 UTC
  - 6b800a2 Merge pull request #53389 from bryceml/2019.2.1
  - 05368a1 Merge branch '2019.2.1' into 2019.2.1
- **PR #53332:** (s0undt3ch) Non optional full test runs for 2019.2.1 @ 2019-06-10 15:51:41 UTC
  - fe18c40 Merge pull request #53332 from s0undt3ch/hotfix/full-test-run-2019.2.1

- 2372733 Merge branch '2019.2.1' into hotfix/full-test-run-2019.2.1
- f8bd47b Merge branch '2019.2.1' into hotfix/full-test-run-2019.2.1
- 45c3c06 Non optional full test runs for 2019.2.1
  - \* 928b05f only fetch pr target branch instead of all branches to save time and disk space
  - \* ccc6106 only keep last 10 builds of every pr on jenkins to reduce disk usage
  - b970bde Merge branch '2019.2.1' into cp-52787
- **PR #53287: (twangboy) Fix win system @ 2019-06-06 23:35:47 UTC**
  - d0810d7 Merge pull request #53287 from twangboy/fix\_win\_system
  - 0fc88fb Add TypeError
  - 5b4160d Try NumberOfEnabledCores
  - 49cbfd4 Add a note about skipping unavailable items
  - 044b56b Fix get\_system\_info for older versions of Windows
- **ISSUE #52173: (amendlik) file.directory fails to check directory permissions correctly (refs: #53385)**
  - **PR #53385: (Akm0d) Check dir\_mode recursively in file.directory**
- **PR #53386: (dwoz) Fix missing import @ 2019-06-06 20:45:59 UTC**
  - cf98b83 Merge pull request #53386 from dwoz/missing\_import
  - a23d6d9 Fix missing import
- **ISSUE #49559: (zyguy) Salt-cloud - proxmox driver - returns AttributeError: 'generator' object has no attribute 'next' (refs: #53240)**
  - **PR #53240: (FireGrace) change .next() to next() py2=>py3 leftover**
- **ISSUE #53274: (Ch3LL) integration.states.test\_pkg failing on amazon 1 py2 (refs: #53323)**
- **PR #53323: (dmurphy18) Fix for issue #53274, test on Amazon Linux 1 @ 2019-06-06 17:31:18 UTC**
  - 18991f9 Merge pull request #53323 from dmurphy18/fix\_53274
  - 6814852 Merge branch '2019.2.1' into fix\_53274
  - bb6c97a Merge branch '2019.2.1' into fix\_53274
  - b84833d Merge branch '2019.2.1' into fix\_53274
  - 7085f36 Fixed pylint issue on PR not showing when run pylint locally
  - 1200031 Updated to use package bash-doc if Amazon Linux 1 after review comments
  - b2a4a5e Fix for issue #53274, test on Amazon Linux 1
  - **PR #53356: (Akm0d) Updated paramiko to version 2.2.3 for python3.7 support**
- **ISSUE #53137: (bryceml) update doc pr's to be built using python3 and sphinx 2.0.1 (refs: #53273)**
- **PR #53273: (s0undt3ch) [2019.2.1] Switch docs building under Py3 @ 2019-06-05 10:01:03 UTC**
  - 1cf57e9 Merge pull request #53273 from s0undt3ch/hotfix/py3-nox-docs-2019.2.1
  - 98653c0 Allow docs to be built on Python >= 3.5, not just Python 3.6
  - c54f06f Have sphinx turn errors into warnings
  - 07f4327 Switch docs building under Py3

- **PR #53361:** (s0undt3ch) [2019.2.1] Only make a new log record if it's a dictionary. @ 2019-06-05 09:56:15 UTC
  - dfd36a2 Merge pull request #53361 from s0undt3ch/hotfix/fix-mp-logging-2019.2.1
  - d70d61f Fully revert 962b11687
- **ISSUE #53171:** (twangboy) integration.states.test\_network.NetworkTest.test\_managed (refs: #53351)
- **PR #53351:** (waynew) Add checks for Amazon Linux to ip module @ 2019-06-04 19:25:58 UTC
  - 5efb670 Merge pull request #53351 from waynew/53171-fix-network-managed
  - e801afe Add checks for Amazon Linux to ip module
- **PR #53242:** (s0undt3ch) [2019.2.1] newer msgpack ipc fixes @ 2019-06-03 23:39:09 UTC
  - **PR #52934:** (twangboy) Update msgpack calls for newer msgpack (refs: #53242)
  - **PR #52755:** (dwoz) Fix non raw msg pack msg decoding (refs: #53242)
  - **PR #52488:** (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (2018.3) (refs: #52755)
  - **PR #52487:** (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (develop) (refs: #53242)
  - ce5d79a Merge pull request #53242 from s0undt3ch/hotfix/msgpack-ipc-2019.2.1
  - d27a524 Merge branch '2019.2.1' into hotfix/msgpack-ipc-2019.2.1
- **PR #53289:** (cmcmarrow) stops pylint E1120 from showing @ 2019-06-01 04:57:27 UTC
  - df448c2 Merge pull request #53289 from cmcmarrow/test\_kubernetes\_lint\_failures\_silenced
  - 03eacac Merge branch '2019.2.1' into test\_kubernetes\_lint\_failures\_silenced
- **PR #53304:** (s0undt3ch) [2019.2.1] Refactor Jenkins PR pipelines to download artifacts after timeout @ 2019-05-31 17:10:19 UTC
  - 6fac22b Merge pull request #53304 from s0undt3ch/hotfix/jenkins-pipelines-refactor-2019.2.1
  - 6e778ef Refactor Jenkins PR pipelines to download artifacts after timeout
- **PR #53297:** (s0undt3ch) [2019.2.1] The TCP transport needs the exact same requirements as the ZeroMQ one @ 2019-05-30 19:42:29 UTC
  - d359513 Merge pull request #53297 from s0undt3ch/hotfix/tcp-transport-tests
  - bec7fa5 The TCP transport needs the exact same requirements as the ZeroMQ one
  - f93e7d3 stops pylint E1120 from showing
  - cbe6423 stops pylint E1120 from showing
  - c5a5d43 test\_kubernetes\_lint\_failures\_silenced
  - b838395 test\_kubernetes\_lint\_failures\_silenced
  - 997d0a8 stops pylint E1120 from showing
    - \* 5542fa8 Add the missing, and required, top pillar file.
    - \* 0ae2ef0 Under Py2 we still want raw to be set to True
    - \* 714d663 Re-submit #52934 fixed after being reverted in #52755
    - \* 243b512 Update msgpack calls for newer msgpack
      - 0f9077b Merge branch '2019.2.1' into cp-52787
- **PR #53264:** (s0undt3ch) [2019.2.1] Minion blackout tests - Add the missing, and required, top pillar file @ 2019-05-29 07:30:45 UTC

- 50e31ec Merge pull request #53264 from s0undt3ch/2019.2.1
- acabb70 Merge branch '2019.2.1' into 2019.2.1
- **PR #52966:** (s0undt3ch) Always run the full test suite on the 2019.2.1 release branch @ 2019-05-28 15:43:12 UTC
  - 749c626 Merge pull request #52966 from s0undt3ch/hotfix/full-test-run
  - 247c461 Always run the full test suite on the 2019.2.1 release branch
- **PR #53138:** (frogunder) vultr cloudtest fix @ 2019-05-28 14:34:22 UTC
  - a7afd31 Merge pull request #53138 from frogunder/fix\_vultr\_cloudtest
  - 9f4550c vultr cloudtest fix
    - \* 912b9b3 Add the missing, and required, top pillar file.
      - 9d21b75 Merge branch '2019.2.1' into cp-52787
- **PR #53258:** (s0undt3ch) [2019.2.1] Fix multiprocessing logging queue dict changing during iteration errors @ 2019-05-27 19:26:27 UTC
  - d011beb Merge pull request #53258 from s0undt3ch/2019.2.1
  - ad01dd2 More robust minion blackout tests
  - a0346d1 Try harder to get the minion grains
  - 36717bd Try and address the test flakyness
  - ce07d8c Add more information when the assertion fails
  - b99e914 Attempt to fix mine tests
  - fca981c One more known to return None
  - 951df48 One more known to return None
  - eb5fd3e Fix *integration.modules.test\_mine.MineTest.test\_get* for sub\_minion
  - 26314f5 Fix multiprocessing logging queue dict changing during iteration errors
- **PR #53153:** (s0undt3ch) [2019.2.1] Add Amazon Linux 2018.3 and 2 static requirements @ 2019-05-27 12:02:20 UTC
  - b69e080 Merge pull request #53153 from s0undt3ch/2019.2.1
  - 166067c Use *currentBuild.resultIsBetterOrEqualTo* instead
  - cefdd90 Stop error messages about missing roster file on syndic master
  - 6bf8f46 Don't complain when attempting to close sockets at this stage
  - e3f3cc9 Add Amazon Linux 2018.3 and 2 static requirements
  - 872acc0 Switch the ubuntu-14.04 exception with amzn-1
  - **PR saltstack/salt#52934:** (twangboy) Update msgpack calls for newer msgpack (refs: #53235)
- **PR #53235:** (s0undt3ch) Revert "Update msgpack calls for newer msgpack" @ 2019-05-24 13:35:20 UTC
  - 14aeeea Merge pull request #53235 from saltstack/revert-52934-fix\_msgpack
  - 3295aea Revert "Update msgpack calls for newer msgpack"
- **PR #53131:** (s0undt3ch) [2019.2.1] Update to salt-bootstrap v2019.05.20 @ 2019-05-24 07:45:57 UTC
  - 6923427 Merge pull request #53131 from s0undt3ch/hotfix/update-bootstrap-2019.2.1
  - 4cce4f4 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1

- 6751ee1 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
- 6988e07 Update to salt-bootstrap v2019.05.20
- **PR #52934:** (twangboy) Update msgpack calls for newer msgpack (refs: #53242) @ 2019-05-23 23:18:23 UTC
  - a61db20 Merge pull request #52934 from twangboy/fix\_msgpack
  - f02a12e Merge branch '2019.2.1' into fix\_msgpack
  - 7e2cd34 Merge branch '2019.2.1' into fix\_msgpack
  - bc9ce8e Merge branch '2019.2.1' into fix\_msgpack
  - 0abd1ec Update msgpack calls for newer msgpack
    - \* 3366d59 update pylint exceptoin
    - \* 6c452b3 removing unwanted commits from this branch
    - \* e0b0ba8 Handling in flaky when maximum number of attempts raised and the exception should be raised. Different approaches depending on Py2 vs Py3.
    - \* 434dcda Disabling two tests when using Python 3 and OS X
    - \* 5784e80 Disabling integration.shell.test\_minion.MinionTest.test\_issue\_7754 test on OS X because it hangs the test suite.
    - \* 78aeb61 Dropping the version check for InstallationError down to anything 1.0 or greater. Removing the test that simulates versions of pip below 1.0.
    - \* 4ec90c2 Adding an jinja if statement to only the python parameter if the result from get\_python\_executable is a valid value. Maintaining backwards compatilby to run tests without Nox.
- **PR #53192:** (twangboy) Skip `test_gen_hash` test on Windows @ 2019-05-23 05:33:13 UTC
  - 8a57270 Merge pull request #53192 from twangboy/skip\_test\_gen\_hash
  - 758d020 Skip test on Windows
- **PR #53157:** (twangboy) Fix `unit.modules.test_win_file.WinFileTestCase.test_issue_52002_check_file_remove_symlink` @ 2019-05-22 22:32:26 UTC
  - 446e70c Merge pull request #53157 from twangboy/fix\_test\_win\_file\_symlink
  - 5672076 Merge branch '2019.2.1' into fix\_test\_win\_file\_symlink
- **PR #53141:** (Ch3LL) Check for all non-word characters when calling `secure_password` @ 2019-05-22 17:24:54 UTC
  - 6fbe9aa Merge pull request #53141 from Ch3LL/shadow\_fed\_fix
  - a3c4066 Merge branch '2019.2.1' into shadow\_fed\_fix
- **PR #53161:** (Ch3LL) Add `HAS_REQUIRED_CRYPT` var for `m2crypto` in `joyent` @ 2019-05-22 13:36:07 UTC
  - fb29512 Merge pull request #53161 from Ch3LL/joyent\_m2crypto
  - 08d03e0 Add `HAS_REQUIRED_CRYPT` var for `m2crypto` in `joyent`
  - 16ef3d2 Merge branch '2019.2.1' into shadow\_fed\_fix
  - 09ff867 Check for all non-word when calling `secure_password`
    - \* 334c93b Elevate token before creating symlink
- **PR #53073:** (Ch3LL) `salt-ssh: python binary exists before version check` @ 2019-05-20 22:36:34 UTC

- 85e9b2f Merge pull request #53073 from Ch3LL/ssh\_py3\_log
- 383e781 Improve logging in salt-ssh gen\_thin
- 4371434 salt-ssh: python binary exists before version check
- **PR #52957:** (Ch3LL) Set default\_flow\_style=None in yaml.dump calls @ 2019-05-16 19:42:35 UTC
  - bd02ea6 Merge pull request #52957 from Ch3LL/yaml\_flow\_style
  - 5f6581a Merge branch '2019.2.1' into yaml\_flow\_style
- **PR #53072:** (Ch3LL) Backport #52754 into 2019.2.1 @ 2019-05-16 19:29:22 UTC
  - **PR #52754:** (garethgreenaway) [2018.3] Fixes to multiprocessing queue when using MacOS (refs: #53072)
  - f410346 Merge pull request #53072 from Ch3LL/bp-52754-2019.2.1
  - 13e5e55 The maximum for the multiprocessing queue on MacOS is 32767, so if we running on MacOS then we use that maximum.
- **ISSUE #52817:** (waynew) unit.modules.test\_telegram.TelegramModuleTest.test\_post\_message (refs: #52972)
- **PR #52972:** (garethgreenaway) [2019.2.1] Fix to unit.modules.test\_telegram @ 2019-05-15 07:50:13 UTC
  - 06fa91b Merge pull request #52972 from garethgreenaway/52817\_unit\_modules\_test\_telegram\_telegrammoduletest\_test\_p
  - cea7131 Removing global declaration.
  - 5bf9a95 Fixing lint.
  - 4d3c46d fixing broken unit.modules.test\_telegram test.
- **PR #53025:** (Ch3LL) Change package name for suse pkg tests @ 2019-05-15 07:41:44 UTC
  - d340cbc Merge pull request #53025 from Ch3LL/suse15\_pkg\_test
  - 0a213ee Change package name for suse pkg tests
- **PR #53020:** (Ch3LL) Change ssh tops log message to debug @ 2019-05-14 16:56:42 UTC
  - c56fbb0 Merge pull request #53020 from Ch3LL/ssh\_tops
  - cbbc764 Merge branch '2019.2.1' into ssh\_tops
- **PR #52973:** (twangboy) Fix integration.states.test\_pip\_state.PipStateTest.test\_issue\_2028\_pip\_installed\_state on Windows @ 2019-05-13 20:56:28 UTC
  - ce099aa Merge pull request #52973 from twangboy/fix\_test\_pip\_state
  - 21838a1 Merge branch '2019.2.1' into fix\_test\_pip\_state
- **PR #52986:** (Ch3LL) Revert "Make sure -run-expensive runtests.py arg works" @ 2019-05-13 19:38:17 UTC
  - 055d374 Merge pull request #52986 from Ch3LL/expensive\_revert
  - 368c012 Revert "Make sure -run-expensive runtests.py arg works"
  - cce263e Merge branch '2019.2.1' into fix\_test\_pip\_state
  - 351d415 Return path to Python instead of None
    - \* c0538d2 Change ssh tops log message to debug
    - \* e317186 Merge branch '2019.2.1' into yaml\_flow\_style
- **PR #52968:** (s0undt3ch) [2019.2.1] Salt >= 2018.3.x supports Py3.7 @ 2019-05-12 21:44:57 UTC
  - ee05da5 Merge pull request #52968 from s0undt3ch/2019.2.1
  - 73c3726 Salt >= 2018.3.x supports Py3.7

- **ISSUE #50310:** (xuhcc) acme.cert falsely reports changes (refs: #50400)
- **PR #52796:** (Ch3LL) Backport #50400 and #50402 into 2019.2.1 @ 2019-05-10 19:30:12 UTC
  - **PR #50402:** (xuhcc) Fix typo in salt.modules.acme (refs: #52796)
  - **PR #50400:** (xuhcc) Fix incorrect change reporting in acme.cert (refs: #50402, #52796)
  - cae51c2 Merge pull request #52796 from Ch3LL/bp-50400
  - 0c2e3e7 Merge branch '2019.2.1' into bp-50400
  - 1268e3e Merge branch '2019.2.1' into bp-50400
  - 09fa9e3 Fix typo
  - 9be5c0c Fix incorrect change reporting in acme.cert
    - \* 9a27fb3 Merge branch '2019.2.1' into yaml\_flow\_style
- **PR #52770:** (twangboy) Fix test\_file\_managed\_should\_fall\_back\_to\_binary on Windows @ 2019-05-09 20:35:02 UTC
  - 20cccd8 Merge pull request #52770 from twangboy/fix\_test\_file
  - ac27e69 Merge branch '2019.2.1' into fix\_test\_file
  - 30a5093 Merge branch '2019.2.1' into fix\_test\_file
  - c08b10d Merge branch '2019.2.1' into fix\_test\_file
  - 340ee23 Pass encoding to \_validate\_str\_list
    - \* 0d0e354 Fix yamldumper test for both py2/py3
    - \* 20bc954 Update docs for yamldumper test
    - \* bf648e5 Update tests/unit/utills/test\_yamldumper.py
    - \* 70d578a Set default\_flow\_style=None in yaml.dump calls
- **PR #52943:** (Ch3LL) Fix elasticsearch state module: allow user to define empty aliases @ 2019-05-09 15:46:38 UTC
  - 4437764 Merge pull request #52943 from Ch3LL/fix\_elasticsearch
  - 451fb7e Merge branch '2019.2.1' into fix\_elasticsearch
  - ebf9b9 Fix elasticsearch state module: allow user to define empty aliases
- **PR #52952:** (s0undt3ch) [2019.2.1] More nox changes and test fixes @ 2019-05-09 15:03:07 UTC
  - 9b290b6 Merge pull request #52952 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a06d7ce We need to call the decorator
  - 77185af Partial revert since this is a class method
  - f5c5771 Lint fixes
  - 3e43c87 Revert "fix compare\_versions method"
  - 0e139bf Fix `GOLDEN_IMAGES_CI_BRANCH` value
  - 12a9408 Add Py3.7 static requirements
  - 8e505fb Move tests to existing test modules
  - 4681609 `tests/unit/config/__init__.py` -> `tests/unit/config/test_config.py`
  - b1dc7f6 Pin to `moto<=1.3.7` because of <https://github.com/spulec/moto/pull/1952>

- 0ffe7ca We no longer test against Ubuntu 14.04 which reached EOL
- 33743fc Don't traceback when trying to close a closed socket
- da2e147 Always cleanup the changed environ
- 087c74d No globals in tests, specially dictionaries!
- a814fc0 Fix underscore wart (and linter)
- 74b8f5f Fix deprecation warning in msgpack >= 0.5.2
- 962b116 Try to address dict changing during iteration
- c58af57 Tweak codeclimate settings for less noise
- 5bb7869 fix linter
- 0b81841 Cherry-pick test fix
- 99f9e1c fix compare\_versions method
- **PR #52853: (s0undt3ch) [2019.2.1] Bring nox into 2019.2.1 @ 2019-05-09 09:52:42 UTC**
  - a510edf Merge pull request #52853 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a8f7b46 Test is not destructive.
  - 63663cf We no longer test against Ubuntu 14.04 which reached EOL
  - 62574ee Typo
  - e3e3761 Proper english in requirements comments
  - e9f6a12 *identical\_signature\_wrapper* adds *\_\_wrapped\_\_* to function globals
  - 10283b4 Upload coverage reports on full test runs
  - 6e0b61b Less flaky mine tests
  - 3709ed7 msgpack returns string\_types
  - a36b15e Add regression test
  - ce782ff Fix non raw msg pack msg decoding
  - f193f0f Update Issue Template: questions removed
  - 4417095 Fix underscore wart (and linter)
  - e6c2ae4 Fix deprecation warning in msgpack >= 0.5.2
  - 6375944 Add ubuntu1804 to pr tests
  - 8fdb04d SIGKILL is not always available use a local variable
  - 4d6b8da Fix linter
  - 759bcc Fix test\_doc on windows by using grep yay!
  - 0ce086d Fix remaining failures on ubuntu 1404 and add to PR tests
  - fdf80fd Change py3 windows timeout from 6 to 8 hours
  - b0aa287 Fix missing class wart
  - 21ecb74 fix linter
  - 62c0f9f Skip tests when no libcloud
  - 1d92290 Fix unused import

- 72cdc91 Fix linter
- 238fd0f Fix broken pip state
- 89533ba Fix `NOX_ENV_NAME`
- 7cfc9e8 Fix `NOX_ENV_NAME`
- 2087c91 Fix `NOX_ENV_NAME`
- 2f1aff5 Rename kitchen-centos6-py3 to kitchen-centos6-py2
- 1eea990 Fix linter
- 52ca668 Skip tests when no libcloud
- 2cf4b98 Add centos-6-py2 and debain 8,9 py2 and 3 to PR tests
- 522599d Dont fail just because some random process died
- 34cef86 Ignore super not called
- b7ace9c Fix linter
- aceb6d3 Skip libcloud unit tests when no libcloud
- f73420b Install mock on Python < 3.6
- 28fbde1 Add `moto` to the windows dependencies
- 8cbecc1 Pin kubernetes to <4.0
- 2acb0f3 Make sure `-run-expensive runttests.py arg` works
- 22cae20 Remove ref restriciton from kitche-salt
- 67095df Add 'runFull' build parameter for PR tests
- 12d8d35 Stop w32time before and start after testing
- 7f1c22c Skip tests that fail on Windows
- f4ae97f Upgrade etcd to > 0.4.2
- 381f5fe Limit and reduce the ammount of log records sent over the wire
- 0c94b5d More entries to ignore
- c3a21f5 As a script, not as a module
- 8948b69 Include `COVERAGE_FILE` as an env variable.
- 0af561e Each generated script is now prepared for code coverage
- 294d6f4 Use the system's path separator
- e52ab87 Always combine and generate the XML coverage report
- 666ca9f Fix proxy minion startup issue on the test suite
- 7838ace `impacket` does not support Py3
- ba8d0fe Allow `-install-only` to gather the required information
- eed7d68 Create nox lint virtualenvs before running them
- e9e57cf Syndic roster not in 2017.7.9
- 111c63a4d Create the roster even when not running ssh
- 11c02a0 Fix `unit.test_loader.LoaderGlobalsTest.test_states`

- 8694db1 Fix windows tests
- 82e9ac5 Avoid race condition in even assertions
- 9443451 Revert part of 927219c since it is not a fix
- 5fee762 Fix timeout logic
- 517650f check timeout when queue empty
- 7c0a9af fix linter
- 961dc40 Ignore missing variable in six module
- 0f5a7f0 Fix typo
- 6c8c418 Do not limit event assert to first event
- 3042292 Wait longer for ping reaction
- 8c10f5f Fix xml block causing docs to fail
- 6e5768a Add a nox session for the Jenkins tornado jobs
- 43321e8 Add a cloud nox session for both runtests and pytest
- b6b4e95 Lint cleanup
- 0670614 Add tests for wraps
- 1670b5d Use functools.wraps with decorators
- 5ae263c Update static requirements for 2018.3 branch
- 3482c4d Disable code coverage uploads.
- 0e5bc67 Lint fixes
- 337c737 Update CI jobs to point to 2018.3
- 72e8603 Skip test if required cypto libs are not available
- e6bc9f8 Default to Cryptodome, fallback to PyCrypto
- b2b0764 Be aware of the different path separators
- 7e79b18 We need to make sure the virtualenv path entry is removed when searching
- ff6d3c6 We don't need to be root to run these tests
- 5965ab4 Disable progress bars on pip installs
- f86a44e Use the real python executable path when running within a virtualenv
- 3d407e8 Add a helper to return the path to the real pytohn executable
- ea9d246 We must also provide `venv_bin` when running within a virtualenv
- 31e91b0 Fix pip tests, in particular under windows
- 493f493 Don't fail if `pkg_resources` is not importable
- a1eb400 Specify the SHA we need
- 0b01f21 Let's fully unload pip
- 0b6f848 Fix docker entries
- 870b899 Remove unused argument
- 1656cb4 Disable re-runing failed tests for now

- 6db4141 Also ignore multiprocessing coverage files
- 83dc97d Actually write the lint reports.
- 5f97270 Try to make sure some pip internal functions are always present in sys.modules after reloads
- 0090c55 Try and address the fact that some python packages are only provided by the distro
- 4a072fe These tests aren't destructive
- 5c7a956 Don't fail the build if the issue was sending a slack notification
- 361ef6e Don't try to change ownership on non existing paths
- 7b17352 More insight(context) on failure reports
- 93b6b95 Lock supervisor to 3.3.5, last known working(passing tests) version
- 51114aa Watch out for too long shebang's
- d97fe82 The output is important to know why it failed.
- 9fef385 Strings and integers are not comparable under Python 3
- d308dce Be verbose in a CI context
- 8b7105e Fix failed tests re-run logic
- d6d8db1 Blacklist *enum34* on Py>=3.4. Update requirements.
- 1cd00c0 Update PR CI jobs for nox
- 19a83d5 Blacklist pycrypto and install pycryptodome instead
- 91376b3 Ignore the generated docs archive
- 207b83a Update compiled requirements
- 535e7a7 Add TCP transport nox sessions
- 680b3e5 Compile requirements for the TCP transport
- 49a1ebe Throw error when running either on Py<2.7 or Py>=3.7
- 10528b9 Don't repeat failed tests on missing/empty failed test files file
- 4886809 We currently only support running lint under Py2.7
- a76981b Remove dead code
- 7b2c1ce Don't require six
- a27ed35 Add nox env to build docs
- e1b3f1d Lock docs python requirements
- c8de644 Fix lint issues under tests
- 0372718 Fix lint issues on salt
- 9eab9f4 Add nox session/env/target to run lint against Salt and it's test suite
- 123f771 Lock lint requirements
- 8df33ad Back to *+apache-libcloud==1.0.0* and skip windows for now
- 43e3ae6 Bump apache-libcloud requirement because 1.0.0 fails to install on windows
- d5f7813 Remove requirements for platforms which aren't tested under Py3
- 8f02ee9 Recompile requirements

- 66626f2 Remove pycryptodome from compiled requirements files
- 75693e5 Use pycryptodomex on windows and PyCrypto on the rest
- 4a9c19c Update(fix) requirements
- 33a3467 We don't test OSX nor Windows under Py3.4
- fd44fce We want a more verbose pip-compile output
- c2ae2d5 We now compile requirements for each of the supported minor version
- 6ee1260 Static requirements are now placed on *py<major>.<minor>* subdirectories
- 3504804 The required crypto library is pulled in from zeromq.txt or raet.txt
- 3ffe03c PyZMQ is pulled in from zeromq.txt
- 7c2fe16 Instead of quoting session parameters, proxy nox sessions
- d3ae77b Add separate crypto sessions
- 0399620 Parametrize the transport
- d33fd03 Update/Generate static requirements to new layout
- 52ac533 Add pre-commit config to generate static requirements
- 3cfc13 Be aware of the new static requirements layout
- dc7e16a Don't lock the docker requirement. It's not locked on the other platforms
- 5476ba2 Kubernetes 3.0.0 does include the requirements files. pip-compile chokes on that
- 79a8261 Previously generated requirements were py2 only
- 1e29666 IOFLO is pulled in from the raet requirements
- 4945e35 Fix pylint on 2017.7.9
- 036bf68 Rerun failed tests
- 03a9601 Ignore *.nox* directory
- 50cb630 We have long files
- db2392f Update CodeClimate settings
- 899c80e Fix integration.client.test\_kwarg test timeouts
- **ISSUE #52836:** (Ch3LL) unit.utils.test\_args.ArgsTestCase.test\_argspec\_report failing (refs: #52852)
- **PR #52852:** (garethgreenaway) [2019.2.1] Fixes to unit.utils.test\_args.test\_argspec\_report @ 2019-05-07 19:25:48 UTC
  - 77355e2 Merge pull request #52852 from garethgreenaway/52836\_test\_argspec\_report\_failing
  - eee5a38 Merge branch '2019.2.1' into 52836\_test\_argspec\_report\_failing
- **PR #52845:** (Ch3LL) Backport #52780 into 2019.2.1 @ 2019-05-07 16:27:21 UTC
  - **PR #52780:** (sbrennan4) Handle ipv6 in \_netlink\_tool\_remote\_on (refs: #52845)
  - dcc5fde Merge pull request #52845 from Ch3LL/bp-52780
  - dfff09b Merge branch '2019.2.1' into bp-52780
- **PR #52851:** (Ch3LL) Reload matcher loader when ext\_pillar\_first set @ 2019-05-07 13:12:07 UTC
  - 2e4f296 Merge pull request #52851 from Ch3LL/matcher\_ext\_pillar

- bdcae5d Add docs for new reload kwarg
- fc70884 Reload matcher loader when ext\_pillar\_first set
- 8ac74e2 Merge branch '2019.2.1' into bp-52780
- 226c7ce Merge branch '2019.2.1' into bp-52780
- c1eae84 Add test
- 69fe65b Use rsplit
  - \* 8fdc48c Removing create\_autospec and having salt.utils.args.argspec\_report run against the \_test\_spec function directly. Depending on the python version, create\_autospec gives different results and cause the test to fail. The test is now more accurate at testing the arguments for the function.
- PR #52842: (s0undt3ch) *libcrypto.OpenSSL\_version\_num* might be a callable @ 2019-05-06 17:00:37 UTC
  - cc7a0d1 Merge pull request #52842 from s0undt3ch/2019.2.1
  - a944017 *libcrypto.OpenSSL\_version\_num* might be a callable
- PR #52839: (twangboy) Add support for EC2 @ 2019-05-04 17:28:54 UTC
  - b625a6a Merge pull request #52839 from twangboy/fix\_test\_grain
  - 1c9b372 Add support for EC2
- ISSUE #51982: (arsiesys) topic (minion\_id) need to be encoded before being hash and sent using zeroMQ (refs: #51983)
- PR #52767: (Ch3LL) [2019.2.1] Add tests to PR #51983 @ 2019-05-03 08:35:27 UTC
  - PR #51983: (arsiesys) encode topic before using hashlib (refs: #52767)
  - 6002939 Merge pull request #52767 from Ch3LL/zmq\_filter\_test
  - 1ee8f37 Merge branch '2019.2.1' into zmq\_filter\_test
  - d74b6ee Merge branch '2019.2.1' into zmq\_filter\_test
  - 3210274 Fix linter warnings
  - e7c9d6e increase timeout when gathering results
  - 784786d Add zmq\_filter unit tests
  - 805c5ee encode topic before using hashlib
- PR #52827: (twangboy) Add pymssql dependency for Windows builds @ 2019-05-03 08:21:40 UTC
  - 5996932 Merge pull request #52827 from twangboy/add\_pymssql
  - 6f0b8e2 Add pymssql dependency for Windows builds
- ISSUE #52717: (Ch3LL) debian9 tests segmentation fault (refs: #52797)
- PR #52797: (garethgreenaway) [2019.2.1] Only run the libcrypto init if less than OpenSSL 1.1.0 @ 2019-05-03 05:12:31 UTC
  - e3918c5 Merge pull request #52797 from garethgreenaway/52717\_debian\_tests\_segmentation\_fault
  - 7ab0961 Merge branch '52717\_debian\_tests\_segmentation\_fault' of github.com:garethgreenaway/salt into 52717\_debian\_tests\_segmentation\_fault
    - \* f8d816e Merge branch '2019.2.1' into 52717\_debian\_tests\_segmentation\_fault
- PR #52771: (twangboy) Fix *test\_gpg* tests on Windows @ 2019-05-02 13:30:18 UTC

- b68544f Merge pull request #52771 from twangboy/fix\_test\_gpg
- c7f45c2 Pass encoding to stringutils.to\_unicode
- PR #52783: (Ch3LL) Fix boto\_apigateway tests for PyYAML 5.1 @ 2019-05-02 13:26:34 UTC
  - 316d05b Merge pull request #52783 from Ch3LL/fix\_boto\_yaml
  - cde29cb Fix boto\_apigateway tests for PyYAML 5.1
  - 6ffbca5 Fixing lint.
  - e24f2f8 Only run the libcrypto init if less than OpenSSL 1.1.0.
- PR #52769: (twangboy) Remove domain grain from tests for Windows @ 2019-04-30 21:14:26 UTC
  - 3509465 Merge pull request #52769 from twangboy/fix\_test\_core
  - 0049f85 Remove domain grain from tests
- PR #52768: (twangboy) Remove pchanges... again... @ 2019-04-30 20:24:27 UTC
  - 30dc14b Merge pull request #52768 from twangboy/fix\_test\_win\_dacl
  - 123b607 Remove pchanges... again...

  - f7d823c Merge pull request #52601 from Ch3LL/cp-52415
  - ecd6802 Merge branch '2019.2.1' into cp-52415
  - 538d5cf Remove pchanges from win\_dacl
  - 81b865f use same newfile message on linux for windows file state
  - 93bdd08 Update dict correctly in file state
  - f3c7f27 remove pchanges for windows file modules
  - fb3b75d Fix tests for pchanges backport into 2018.3
  - 0f296bb Update kernelpkg test to reflect pchanges removal
  - 885d6ff Update file.touch unit tests to reflect addition of changes in test mode
  - 4bc5fd0 Add integration tests for test mode onchanges/prereq
  - ed214c4 Make it possible to use prereq with test and saltmod state mods
  - ceb3f4d Add repack\_state\_returns to TestCase
  - 982e693 Add exception logging in flaky decorator
  - 0ba0ddf Add test mode changes to file.touch state
  - 6db2beb Replace "pchanges" with "changes" to fix onchanges/prereq requisites
    - \* 169c2d5 Chattr version py3 fix
    - \* cf88c27 Fix linter issues
    - \* 0ea007d Parse chattr version and fix test case
- ISSUE #52508: (Ch3LL) integration.modules.test\_publish test failures (refs: #52645)
- PR #52645: (dwoz) Fix salt.modules.publish and salt.states.x509 tests @ 2019-04-20 08:17:19 UTC
  - af4f204 Merge pull request #52645 from dwoz/test\_fixes

- 9b6f9f9 Clean up cruft
- c3971a5 Fix salt.modules.publish and salt.states.x509 tests
- **PR #52629:** (dwoz) Fix event assertion race condition @ 2019-04-19 19:03:20 UTC
  - **PR #52540:** (dwoz) Fix race condition in event assertion (refs: #52629)
  - 0a4d2d9 Merge pull request #52629 from dwoz/ping\_wait\_2019.2.1
  - c001022 Fix linter
  - 423f6f9 Fix vent assertion race condition
- **PR #52619:** (dwoz) Remove unused method from pytest engine @ 2019-04-18 23:45:35 UTC
  - 4859e6c Merge pull request #52619 from dwoz/pytest\_engine\_2019.2.1
  - 105784a Remove unused method from pytest engine
- **PR #52614:** (Ch3LL) [2019.2.1] Update integration.modules.test\_network.NetworkTest.test\_network\_ping... @ 2019-04-18 21:54:28 UTC
  - 77943e5 Merge pull request #52614 from Ch3LL/cp-test\_network-2019.2.1
  - 27c79d2 Update integration.modules.test\_network.NetworkTest.test\_network\_ping test address
- **ISSUE #32245:** (tkwilliams) git\_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)
- **PR #52615:** (twangboy) Bring 51661 into 2019.2.1 @ 2019-04-18 21:53:35 UTC
  - **PR #51661:** (sathieu) git\_pillar: Fix all\_saltenvs on base env (refs: #52615)
  - **PR #51597:** (sathieu) git\_pillar: Fix all\_saltenvs on base env (refs: #51661)
  - **PR #50768:** (sathieu) git\_pillar: Add support for all\_saltenvs parameter (refs: #51597, #51661)
  - c6b4986 Merge pull request #52615 from twangboy/gitfs\_2019.2.1
  - d952674 Merge branch '2019.2.1' into gitfs\_2019.2.1
- **ISSUE #52547:** (cbosdo) virt.purge throws a libvirt exception on Xen hypervisor (refs: #52548)
- **PR #52548:** (cbosdo) Virt purge fix @ 2019-04-18 20:07:36 UTC
  - 8ee15a9 Merge pull request #52548 from cbosdo/virt-purge-fix
  - 6ca8f4b Try/except undefineFlags() as this operation is not supported on bhyve
    - \* 5a0464b Bring 51661 into 2019.2.1
- **PR #52591:** (Ch3LL) [2019.2.1] Update test\_schema to mirror the new ValidationErrors in 3.0.0 @ 2019-04-18 16:34:22 UTC
  - e03aed5 Merge pull request #52591 from Ch3LL/fix\_jsonschema\_2019.2
  - e09be842 Update test\_schema to mirror the new ValidationErrors in 3.0.0
- **ISSUE #52525:** (lomeroy) deserializer\_opts are not passed the serializer in file.serialize (refs: #52526)
- **PR #52526:** (lomeroy) Fix use of deserializer\_opts in file.serialize @ 2019-04-17 14:08:52 UTC
  - 21d6365 Merge pull request #52526 from lomeroy/deserializer\_opts\_fix
  - ea0520c update test for serialization opts
  - 84ff03a Correct attempting to use the serializer\_name to pull deserializer\_opts when deserializer\_name is used as the key in the deserializer\_options dict.

- **ISSUE #49147:** (furgerf) Log filled with "Exception occurred while Subscriber handling stream: Already reading" (refs: #51963)
- **PR #52570:** (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) 2019.2 @ 2019-04-17 14:03:02 UTC
  - **PR #52564:** (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) (refs: #52570)
  - **PR #52445:** (dwoz) Simplify IPCClient and prevent corrupt messages (refs: #52564)
  - **PR #51963:** (DmitryKuzmenko) Allow multiple instances of IPCMessageSubscriber in one process (refs: #52564)
  - e522ffe Merge pull request #52570 from DSRCorporation/bugs/revert\_51963\_2019.2
  - fabbcac A couple of race conditions fixes and a test update.
  - 9c85734 Drop singleton from IPCClient
  - 7cf6d54 Revert "Support parallel work of multiple IPCMessageSubscribers in one process"
  - 7f26e76 Revert "Update doc conf with the new import *tornado.queues*"
  - 69e9416 Revert "Minor: Fix typo in docstring"
- **ISSUE #52449:** (Ch3LL) integration.cloud.clouds.test\_gce.GCETest.test\_instance\_extra failure (refs: #52551)
- **PR #52551:** (garethgreenaway) [2019.2] Marking the two tests in test\_gce as flaky @ 2019-04-17 14:00:39 UTC
  - b173406 Merge pull request #52551 from garethgreenaway/52449\_test\_gce\_random\_failures
  - 28af717 Marking the two tests in test\_gce as flaky.
- **ISSUE #51842:** (mattLLVW) salt.auth.django docs use wrong model name (refs: #52553)
- **PR #52553:** (mattLLVW) fix: #51842 @ 2019-04-17 13:59:45 UTC
  - 8352362 Merge pull request #52553 from mattLLVW/fix\_django\_auth\_docs
  - 3baeedf fix: #51842
- **ISSUE #52134:** (sploenix) Regression: Include list of pillar files under different keys in 2019.2 (refs: #52490)
- **ISSUE #22063:** (jeanpralo) Wildcard inside top.sls file for pillar (refs: #52490)
- **PR #52490:** (dwoz) Fix pillar include regression @ 2019-04-17 13:54:39 UTC
  - 9faa49c Merge pull request #52490 from dwoz/issue\_52134
  - 876dd18 Fix merge wart
  - 2ed650b Merge remote-tracking branch 'saltstack/2019.2' into issue\_52134
  - b0af11f Run include tests when pillar source changes
  - 307cec6 Fix pillar tests
  - 1a33bde import `__future__.absolute_import`
  - 5dc5de9 Use file encoding and add docstring
  - e84cd41 Fix pillar include wart
  - c79f496 Add pillar include tests
  - 7745242 Revert "Fix #22063: pillar wildcard support include"
- **PR #52552:** (twangboy) Bring 52170 into 2019.2 @ 2019-04-17 13:54:17 UTC
  - **PR #52170:** (twangboy) Fix issue when task doesn't have delay\_random defined (refs: #52552)

- b0c0237 Merge pull request #52552 from twangboy/fix\_win\_task\_2019.2
- fd19cca Remove some warts in the docs
- deb0b10 Fix some lint
- a279d45 Final doc fixes
- 58f0cd2 Fix docs... attempt 6
- a66716e Fix docs... attempt 5
- f6f3381 Fix docs... attempt 4
- 18cfc15 Fix docs... attempt 3
- c691e0d More doc fixes
- e01077b Fix docs issue... maybe...
- b649495 Honor 80 character line limit
- eba4507 Bring 52170 into 2019.2
- **PR #52528: (Ch3LL) [2019.2]** Merge forward from 2018.3 to 2019.2 @ 2019-04-17 13:53:46 UTC
  - cc0cd5d Merge pull request #52528 from Ch3LL/merge-2019.2
  - 87cf385 increase timeout on test\_state for windows
  - 3442202 Increase timeout for test\_kwarg tests
  - 2c3ff2f Merge branch '2019.2' into merge-2019.2
- **PR #52534: (twangboy)** Add TLS support up to TLS 1.2 @ 2019-04-13 22:56:41 UTC
  - e91240b Merge pull request #52534 from twangboy/tls\_support\_2019.2
  - 9ec54c4 Add TLS support up to TLS 1.2
    - \* 474efa1 Fix pylint and state test failure
    - \* 048a82e Merge branch '2019.2' into merge-2019.2
- **PR #52536: (twangboy)** Bring #52191 into 2019.2 branch @ 2019-04-12 21:31:23 UTC
  - **PR #52191: (twangboy)** Fix issue where version doesn't detect when check\_remote=True (refs: #52536)
  - 2c42e4d Merge pull request #52536 from twangboy/fix\_choco\_2019.2
  - b394ad5 Bring #52191 into 2019.2 branch
  - 795a7f6 Fix windows tests - increase timeout
  - c70772c Fix linux state tests- add new comment
  - 2941567 Merge branch '2018.3' into '2019.2'
  - 262516c Merge pull request #52209 from twangboy/fix\_choco\_retcode
    - \* 7aec2d3 Merge branch '2018.3' into fix\_choco\_retcode
    - \* bfdc47b Handle new enhanced retcode 2
  - dd7a4ba Merge pull request #52046 from twangboy/use\_reg\_timezone
    - \* fc8e970 Merge branch '2018.3' into use\_reg\_timezone
    - \* d0987e6 Merge branch '2018.3' into use\_reg\_timezone
    - \* 1bf0cbc Merge branch '2018.3' into use\_reg\_timezone

- \* b466f8a Merge branch '2018.3' into use\_reg\_timezone
- \* 34bdae5 Merge branch '2018.3' into use\_reg\_timezone
- \* 9a8afa6 Fix tests, add null byte test
- \* 59b1d4f Revert back to using reg to get timezone
- 0d09608 Merge pull request #52396 from dmurphy18/fix\_aix\_ssh
  - \* 8bfa340 Correct typo
  - \* 6d98577 Altered code to support salt-ssh on AIX
- 576478e Merge pull request #52473 from Ch3LL/bp-49437
  - \* 781385f Merge branch '2018.3' into bp-49437
  - \* 3a3114d Fix merge conflict wart
  - \* bbfd412 Merge branch '2018.3' into bp-49437

  - 83bed46 Add missing symlink test
- **PR #52341:** ([cbosdo](#)) virt.pool\_running: fix pool start @ 2019-04-12 00:14:52 UTC
  - 7a1b8ca Merge pull request [#52341](#) from cbosdo/virt-state-fixes
  - 89f0bd8 Merge branch '2019.2' into virt-state-fixes
  - 25b9681 virt.pool\_running: fix pool start

- 30981d2 Remove unneeded kwargs in virt states
- 0871c02 virt: allow defining the VM type and arch when creating it
- 1c65d25 Updating running domains in virt.running
- 13d7819 Add missing virt states unit tests
- 0681d86 virt.running support for all virt.init options
- c6a444b Add test case for virt.running
- 2db7a98 Let virt running state provide errors
- **ISSUE #52350:** (Ch3LL) Re-Add Python 2 unicode string literals in YAML renderer (refs: #52427)
- **PR #52427:** (garethgreenaway) [2019.2] Support for old yaml render @ 2019-04-12 00:06:37 UTC
  - 6040282 Merge pull request #52427 from garethgreenaway/52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - 82f010a Merge branch '2019.2' into 52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - ae81fee Merge branch '2019.2' into 52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - b618d44 Merge branch '2019.2' into 52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - b191bc0 Merge branch '2019.2' into 52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - 38a9818 Merge branch '2019.2' into 52350\_readd\_and\_gate\_unicode\_string\_literal\_support
  - 2767984 Removing logging entry
  - 71cd303 Adding missing yamlloader\_old.py
  - f848aa4 Adding support back in with, a gated configuration option, for the old YAML Loader.
- **ISSUE #51865:** (magenbrot) salt.match.search\_by resulting in 'None' since 2019.2 (refs: #52234)
- **PR #52234:** (garethgreenaway) [2019.2] Fixes to matchers when used in pillar @ 2019-04-12 00:05:48 UTC
  - 05ba7c5 Merge pull request #52234 from garethgreenaway/51865\_match\_search\_by\_master
  - 1760245 Merge branch '2019.2' into 51865\_match\_search\_by\_master
  - d50f011 Merge branch '2019.2' into 51865\_match\_search\_by\_master
  - b0cbb60 Merge branch '2019.2' into 51865\_match\_search\_by\_master
  - 799a08b Merge branch '2019.2' into 51865\_match\_search\_by\_master
  - 21891d6 Merge branch '2019.2' into 51865\_match\_search\_by\_master
  - a2173d7 Fixing a typo where attempting to get a list from \_\_opts\_\_ instead of an individual item
  - 6a5b5b2 swapping out if...else approach for \_\_opts\_\_.get approach.
  - aa2c626 With the change/addition of the matcher subsystem in 2019.2, the match.search\_by when used in pillar broke when targetting the minion that was also the salt master. This was caused by the id in \_\_opts\_\_ being used in all cases. This change updates the glob\_match function to use the preserved minion\_id of the master if it is available so that targeting works as expected.
- **PR #52160:** (cbosdo) Virt whitespace fix @ 2019-04-12 00:04:25 UTC
  - 80d7aea Merge pull request #52160 from cbosdo/virt-whitespace-fix
  - fd1f539 Merge branch '2019.2' into virt-whitespace-fix
  - b297e7d virt: handle whitespaces in VM names
- **ISSUE #51832:** (nocturo) pillar include stopped working (refs: #52008)

- **PR #52008:** ([waynew](#)) Allow / in pillar includes @ 2019-04-12 00:02:40 UTC
  - b551bbd Merge pull request #52008 from waynew/51832-re-allow-slash-includes
  - ee3115f Allow leading dots and / as pillar separators
  - 29c676d Ensure \_closing exists
  - eb517e1 Swap '/' for '.' when matching
- **ISSUE #51821:** ([OrangeDog](#)) 'comment' is an invalid keyword argument for 'test.fail\_without\_changes' (refs: #51937)
- **PR #51937:** ([garethgreenaway](#)) [2019.2] Fix to test state functions to allow arguments that mod\_watch uses @ 2019-04-11 23:57:44 UTC
  - d3159cb Merge pull request #51937 from garethgreenaway/51821\_ensure\_result\_comment\_changes\_valid\_arguments
  - 86c63b5 Merge branch '2019.2' into 51821\_ensure\_result\_comment\_changes\_valid\_arguments
  - 0966d61 Merge branch '2019.2' into 51821\_ensure\_result\_comment\_changes\_valid\_arguments
  - 5527dff Ensure the comment, changes, and result are valid arguments for various test state functions as they are valid arguments for mod\_watch.
- **ISSUE #51818:** ([syphernl](#)) salt.nacl.dec: expected str, bytearray, or unicode (refs: #51913)
- **PR #51913:** ([garethgreenaway](#)) [2019.2] Fixes to utils/nacl.py @ 2019-04-11 23:56:57 UTC
  - 7be0428 Merge pull request #51913 from garethgreenaway/51818\_fix\_when\_sk\_is\_empty

  - \* 8461608 Updating the incron module, state module and tests to remove use of comments.
    - 855f31a Remove un-used file
    - affd9b8 Fix setup/teardown methods
    - 215bf93 Refresh after modifying tmp pillars
    - 95c3aba Add config for listener
    - 5d231f4 remove unused import
    - 8c1b1db Use tmp pillar for signing policies
    - a0e2458 fix unused import
    - 7f5f7dd Fix requisite path
    - 5630498 Fix signing policies path
    - 0bd0826 Fix issue #51869 and add cert signing test
- **PR #52347: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-28 16:41:53 UTC**
  - 27e6cbf Merge pull request #52347 from Ch3LL/merge-2019.2
  - 63962b5 Merge branch '2018.3' into '2019.2'
  - bda3ca2 Merge pull request #51749 from terminal-labs/salt-cloud-map-alt-update
    - \* 9ca0f72 Changed where to mention the map files compatibility for minion configuration options. This is a result of @Ch3LL suggestion on the PR itself for this doc change.
    - \* 364ef06 Added mention of map file alternative for minion configuration options.
  - a743fff Merge pull request #52113 from twangboy/fix\_lgpo
    - \* bb4a704 Merge branch '2018.3' into fix\_lgpo
    - \* 7186405 Merge branch '2018.3' into fix\_lgpo
    - \* 7656331 Change default language from 1033 to en\_US
  - 7040643 Merge pull request #52172 from garethgreenaway/51959\_fix\_acl\_present\_output
    - \* 8c53890 Merge branch '2018.3' into 51959\_fix\_acl\_present\_output
    - \* 0bdde94 Merge branch '2018.3' into 51959\_fix\_acl\_present\_output
    - \* c5337e1 Merge branch '2018.3' into 51959\_fix\_acl\_present\_output
    - \* 889660f Fixing lint.
    - \* bfdb669 Updating the reverse octal lookup dictionary. Updating tests.
    - \* 24c907b Adding additional permissions to the lookup.
    - \* 4b99afa Fixing the output when there are changes for the ACL state so the permissions are shown and not the octal number.

- 45d6cad Merge pull request [#52283](#) from dmurphy18/fix\_cpe\_name\_amzn2
  - \* cbe5f7d Update to allow for malformed CPE\_NAME from some OS's
- 14a6b9d Merge pull request [#52306](#) from terminal-labs/replace-ping-with-version
  - \* c04ba6e Changed a text artifact from the ping function to supporting text for the version function.
  - \* 0b1eb00 Replaced *test.ping* with *test.version* Result of issue [#52277](#)
- 7b2b521 Merge pull request [#51963](#) from DSRCorporation/bugs/49147\_ipc\_subscriber
  - \* 37aeba3 Minor: Fix typo in docstring

  - 904beb3 [2018.3] change build\_type and release in doc/conf.py
  - 3efcea5 Update release versions for the 2018.3 branch

- \* 98f1b03 Merge pull request [#51775](#) from [garethgreenaway/merge-2017.7](#)
  - [92ffe03](#) fixing lint
  - [73b601d](#) Merge branch '2017.7' into merge-2017.7
  - [e04f735](#) Merge pull request [#51502](#) from [ogd-software/51501-states-boto3\\_route53.py-fails-to-validate-ALIAS-A-records](#)
  - [e69ce9d](#) Merge branch '2017.7' into 51501-states-boto3\_route53.py-fails-to-validate-ALIAS-A-records
  - [5093406](#) Implement PEP8 E711 styling fix
  - [7640e90](#) Ensure boto3\_route53 correctly validates existing ALIAS records
  - [ff633b0](#) Ensure boto3\_route53 survives attempts to validate ALIAS records
  - [9c128aa](#) Merge pull request [#51732](#) from [s0undt3ch/features/nox-2017.7](#)
  - [328989d](#) Add initial nox configuration. Tell *tox*'ers to use *nox*'.
  - [99ce48d](#) Merge pull request [#51712](#) from [dwoz/gemstestagain](#)
  - [0d3b227](#) Fix ruby gems tests, again
  - [18452c4](#) Merge pull request [#51528](#) from [twangboy/backport\\_51471](#)
  - [8c79f02](#) Merge branch '2017.7' into backport\_51471
  - [20a7ee5](#) Backport 51471
  - [ee80ce3](#) Merge pull request [#51655](#) from [garethgreenaway/49661\\_starting\\_salt\\_master\\_openssl](#)
  - [f647b95](#) Merge branch '2017.7' into 49661\_starting\_salt\_master\_openssl
  - [1831e64](#) Removing options from `libcrypto.OPENSSSL_init_crypto` so it will simply use the defaults.
  - [8d0f801](#) removing `salt.crypt` from `payload.py` which is not used and causing salt-key to break.
  - [a5a54c4](#) Removing unused import which is causing salt-master to not start when using openssl 1.1.1-1.
  - [c9c082c](#) Fix `azurearm` field list doc error
  - [af0537f](#) Add azure state and execution modules to doc index
- **PR #52004:** ([chdamianos](#)) Fixed comparison of *None* with constants (refs: [#52030](#)) @ 2019-03-06 17:41:52 UTC
  - [01bccf0](#) Merge pull request [#52004](#) from [chdamianos/fix-constants-comparison](#)
  - [6fd60af](#) Fixed comparison of *None* with constants
- **PR #51981:** ([bryceml](#)) Fix typo in 2019.2.0 release notes @ 2019-03-05 23:59:33 UTC
  - [8d6bb5d](#) Merge pull request [#51981](#) from [bryceml/2019.2](#)
  - [ecf0ef0](#) Fix typo in 2019.2.0 release notes
    - \* [a65e621](#) Adding an additional note warning that the file will not be changed because `test=True`, but could be changed by other states.
    - \* [6c0dcf2](#) Swapping `pchanges` for `changes` in file state.
- **ISSUE #51825:** ([OrangeDog](#)) `schedule.disable` doesn't work in 2019.2.0 (refs: [#51855](#))

- **PR #51855:** (garethgreenaway) [2019.2] Global enable/disable was being ignored @ 2019-03-05 19:40:34 UTC
  - c3105df Merge pull request #51855 from garethgreenaway/51825\_scheduled\_global\_enabled
  - 301e773 Merge branch '51825\_scheduled\_global\_enabled' of github.com:garethgreenaway/salt into 51825\_scheduled\_global\_enabled
    - \* ae7ab06 Merge branch '2019.2' into 51825\_scheduled\_global\_enabled
    - \* ff13833 Merge branch '2019.2' into 51825\_scheduled\_global\_enabled
  - 9e7e4ed Fixing broken add\_job test.
  - 72466a5 Global enable/disable was being ignored
- **ISSUE #51745:** (fayak) Systemd update 241 on archlinux breaks systemd.py version() function (refs: #51946)
- **PR #51946:** (Ethyling) Fix retrieve systemd version using regex @ 2019-03-05 19:20:19 UTC
  - be28623 Merge pull request #51946 from Ethyling/fix-systemd-version
  - b557707 Add test for systemd version from git describe
  - 94809d0 Fix retrieve systemd version using regex
- **ISSUE #51816:** (jkrauz) pillar\_ldap broken in 2019.2.0 (refs: #51964)
- **PR #51964:** (dwoz) [2019.2] Make sure ldap attrs are string types on python 2 @ 2019-03-05 19:18:30 UTC
  - c310022 Merge pull request #51964 from dwoz/issue\_51816
  - a879140 Merge branch '2019.2' into issue\_51816
  - 0e61cf3 Fix linter errors/warnings
  - 171217a Revert debug logging
  - 8c641c6 make LDAP attr defaults string types on py2
- **PR #51976:** (s0undt3ch) [2019.2] Nox fixes @ 2019-03-05 18:56:49 UTC
  - cb817f1 Merge pull request #51976 from s0undt3ch/features/nox-2019.2
  - 0b4e68c Lint fixes
  - 257b3fc Windows needs special treatment
  - b298da0 Requirements fixes
  - 4f45a7e We need a fixed winrm-fs so that dotfiles are also included
  - fa70af2 use kitchen-salt from my fork for now
- **PR #51761:** (sdodsley) Add new module to release notes for 2019.2.0 @ 2019-03-05 09:44:56 UTC
  - **PR #51681:** (sdodsley) Add new module to release notes for 2019.2.0 (refs: #51761)
  - f867e6e Merge pull request #51761 from sdodsley/cheery\_pick\_fb\_releasenotes
  - 80192c8 Add new module to release notes for 2019.2.0
- **PR #51799:** (s0undt3ch) Catch attribute error @ 2019-03-05 09:38:08 UTC
  - 08e3956 Merge pull request #51799 from s0undt3ch/2019.2
  - 342244a Merge branch '2019.2' into 2019.2
  - 3e8a17e Catch attribute error
- **PR #51810:** (Ch3LL) Add 2019.2.1 release notes @ 2019-03-05 09:26:47 UTC

- ff5d7d6 Merge pull request #51810 from Ch3LL/2019.2.1\_rn
- aae5fa Add 2019.2.1 release notes
- ISSUE #51824: (OrangeDog) schedule.present state not idempotent in 2019.2.0 (refs: #51849)
- PR #51849: (garethgreenaway) [2019.2] Fix to schedule.list function to filter out attributes that are None @ 2019-03-01 19:56:17 UTC
  - PR #51647: (dwoz) [develop] increase batch test timeout on windows (refs: #51849)
  - 3732004 Merge pull request #51849 from garethgreenaway/51824\_splay\_breaking\_schedule\_present
  - a0af441 Merge branch '2019.2' into 51824\_splay\_breaking\_schedule\_present
- PR #51878: (Ch3LL) Add new terraform salt-ssh roster feature to release notes @ 2019-02-27 19:18:49 UTC
  - 3fdb564 Merge pull request #51878 from Ch3LL/terraform\_rn
  - 502d197 fix spelling error in release notes
  - 4d53b41 Add new terraform salt-ssh roster feature to release notes
- PR #51837: (stratusjerry) Update win\_pkg.py @ 2019-02-26 16:51:35 UTC
  - PR #49039: (stratusjerry) Update win\_pkg.py (refs: #51836, #51837)
  - e63c872 Merge pull request #51837 from stratusjerry/backport\_49039\_2019.2
  - 531b23d Update win\_pkg.py
  - 39b5645 Splay defaulting to None internally, broke schedule.present causing it to always report differences when a state is run. Updating the schedule.list function to check if an attribute is None and remove it.
- PR #51772: (Ch3LL) Update release versions for the 2019.2 branch @ 2019-02-25 14:16:40 UTC
  - 27dd9fb Merge pull request #51772 from Ch3LL/doc\_conf\_2019
  - f28cc9b [2019.2] change build\_type and release in doc/conf.py
  - 4c670e2 Update release versions for the 2019.2 branch
- PR #51776: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-02-24 22:08:58 UTC
  - 45425a4 Merge pull request #51776 from garethgreenaway/merge-2018.3
  - 186306a reverting change in release notes, adding change to doc/ref/modules/all/index.rst.
  - 1ef140a Fixing lint.
  - 6173578 Fixing lint errors
  - 38dcab9 fixing lint
  - e37fc20 Merge branch '2018.3' into merge-2018.3
  - 7e3e71c Merge pull request #51756 from twangboy/fix\_case\_sensitive
    - \* 4c55040 Fix failing py3 tests
    - \* 64f45f8 Make recurse and directory case sensitive
  - e75fc1c Merge pull request #51747 from ymasson/fix\_mysql\_grants
    - \* f614dd7 Fix escaping for special charaters
  - b1f7e85 Merge pull request #51387 from chrillux/make-binarydata-output-possible
    - \* 010393e Make binary data output possible

- 3475813 Merge pull request #51694 from assafShapira/2018.3
  - \* 895b97a Merge branch '2018.3' into 2018.3
  - \* bc2d27a fix minion bootstrapping issue `"/usr/lib/python2.7/site-packages/salt/utils/cloud.py"`, line 472 Configuration value `u'provider'` needs to be set
- c7136cb Merge pull request #51738 from garethgreenaway/nftables\_cleanup
  - \* 8201d1e Fixing lint.
  - \* d681064 Merge branch '2018.3' into nftables\_cleanup
  - \* e37458e Fixing a couple tests.
  - \* ed1b743 Additional cleanup. Adding additional documentation for state module.
  - \* dc4afbb More updates to nftables module, state modules, and unit tests.
  - \* 3ec96e3 initial work to cleanup the nftables module, state module, and the unit tests.
- 2121049 Merge pull request #51733 from s0undt3ch/features/nox-2018.3
  - \* 97532c2 Add initial nox configuration. Tell `tox`'ers to use `nox`'.
- f4adf33 Merge pull request #51728 from gtmanfred/virtualnames
  - \* 61b4390 fix modulenames from virtualnames tests
- d681fb9 Merge pull request #51721 from dwoz/solarisipstests
  - \* 3263d31 Merge remote-tracking branch 'saltstack/2018.3' into solarisipstests
- fb0a538 Merge pull request #51676 from Ch3LL/merge-2018.3.4
  - \* 8111479 Merge branch '2018.3' into merge-2018.3.4
- e08f08d Merge pull request #50812 from gtmanfred/virtualnames
  - \* d59952f Merge branch '2018.3' into virtualnames
  - \* 33bb5bf fix use of virtualname
    - 2ca1253 Merge branch 'merge-2018.3.4' of github.com:Ch3LL/salt into merge-2018.3.4
    - 6d6910a Merge branch '2018.3' into merge-2018.3.4
    - b5a6265 Fix ruby gems tests, again
    - 05f2797 Merge branch '2018.3' into merge-2018.3.4
    - 9f0999f Merge branch '2018.3' into merge-2018.3.4
    - 139daa8 Merge branch '2018.3.4' into 2018.3
    - 9741289 Merge pull request #51646 from dwoz/batch\_exit\_2018.3.4
    - a8f25bb increase batch test timeout on windows
    - 9caafec Skip solarisips when not on solaris
- 31c6785 Merge pull request #51714 from dwoz/gemstestagain\_2018.3
  - \* fab74bb Fix ruby gems tests, again
- 39aadfb Merge pull request #51689 from gtmanfred/2018.3
  - \* 8c35d51 fix import
  - \* 6a55cfd specify minimum version of shade module

- a475b70 Merge pull request #51469 from s0undt3ch/hotfix/fix-suse-locale-docker
  - \* 14f49b5 Don't prevent `get_locale` from working when running under docker
- a59585d Merge pull request #51671 from Ch3LL/merge-2018.3
  - \* 64322db Fix `is_windows` utils call
  - \* a5c8df0 Fix pylint
  - \* 547889b Merge branch '2017.7' into '2018.3'
    - bcc13db Merge pull request #51562 from gilbrechbuhler/fix\_rabbitmq\_policy\_change\_check
    - ed2b1e1 Fix RabbitMQ policy definition update check
    - cafaa98 Merge pull request #51648 from dwoz/increase\_wait
    - e2377a9 Merge branch '2017.7' into increase\_wait
    - e3d28d9 Merge pull request #51643 from dwoz/batch\_exit
    - 42d1d02 increase batch test timeout on windows
    - 7c2d7a4 Increase minion wait for slow boxes
    - b5ae53a Merge pull request #51631 from Ch3LL/lint-2017
    - c0aa4dc Fix linter by ignoring `async await` check.
    - 396622c Merge branch '2017.7' into lint-2017
    - ba8d0ea Merge pull request #51547 from s0undt3ch/2017.7
    - 8e009e0 Allow NOT to install pip dependencies
    - 30ce509 Merge pull request #51182 from lmf-mx/darwin-plist-update
    - 4297c0d Merge branch '2017.7' into darwin-plist-update
    - 68ac07f Merge pull request #51442 from dwoz/multi\_master
    - 40cb4db Merge branch '2017.7' into multi\_master
    - 2dc5171 Handle multi\_master failover when daemonized
    - 8df083c Merge pull request #51608 from dwoz/wait\_minions\_2017.7
    - c55359f fix linter
    - 4702e22 Wait for minions to be pingable before starting tests
    - 5afa0a1 Merge branch '2017.7' into darwin-plist-update
    - f46e8be Fix service name in minion plist
    - 1da9cd9 Fix pylint on 2017.7
    - 39122ca Merge pull request #51589 from dwoz/script\_fix\_2017.7
    - 8697ce7 Disable pylint checks, only for 2017.7
    - e5972f5 Use the code directory instead of `cwd` for python path
- b8764fd Merge pull request #51680 from Ch3LL/bp-50336
  - \* 3502dbb `states.gpg`: fix missing existing keys; `modules.gpg`: fix set trust level command
- **PR #51734:** (s0undt3ch) [2019.2] Add initial `nox` configuration. Tell `tox`'ers to use `nox`'. @ 2019-02-21 17:39:29 UTC

- 1894082 Merge pull request #51734 from s0undt3ch/features/nox-2019.2
- 01b74c0 Add initial nox configuration. Tell *tox*'ers to use *nox*'.
- **PR #51707: (isbm) Bugfix: pillar refresh @ 2019-02-21 15:12:49 UTC**
  - 74db589 Merge pull request #51707 from isbm/isbm-pillar-refresh-fix
  - 269ae76 Refresh matchers and beacons on pillar refresh
- **PR #51674: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-02-20 17:35:07 UTC**
  - 82cbd98 Merge pull request #51674 from Ch3LL/merge-2019.2
  - 4171271 Fix pylint, remove unused import
  - 3f14619 Remove skipif and change expected return for solarisips test
  - d3660d5 Merge branch '2019.2' into merge-2019.2
- **PR #51715: (dwoz) [2019.2] Fix ruby gems tests, again @ 2019-02-19 21:44:21 UTC**
  - 7a82c65 Merge pull request #51715 from dwoz/gemstestagain\_2019.2
  - 95ce288 Fix ruby gems tests, again
  - 043efa0 Skip solarisips when not on solaris
  - 7ed0d7d Fix ruby gems tests, again
  - b46eac3 Merge branch '2019.2' into merge-2019.2
- **PR #51561: (isbm) SaltSSH: fix delay when creating thin TAR @ 2019-02-19 10:15:47 UTC**
  - 0bd2d6e Merge pull request #51561 from isbm/isbm-saltssh-thintar-delay-fix
  - 2b02975 Give up on sync for Py3 because of the way tests for py2 are written here
  - f79c81a Update UT mocking, adjusting for temporary file
  - 2f90054 Use temporary filename instead of output directly to the "thin.tgz"
  - d841164 Copy over the result, cleanup afterwards
  - c6792ee Add a function that reserves temporary filename for further tarball generation
- **PR #51678: (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ 2019-02-17 19:02:33 UTC**
  - 5f9764a Merge pull request #51678 from Ch3LL/merge-2019.2.0.rc
  - f8372ca Merge branch '2019.2' into merge-2019.2.0.rc
- **ISSUE #51503: (garethhowell) smartos.image\_present fails with "does not exist" (refs: #51383)**
- **ISSUE #51351: (garethhowell) Exception using smartos.vm\_present to create docker zone (refs: #51383)**
- **PR #51679: (Ch3LL) Backport #51383 into 2019.2 @ 2019-02-16 00:31:06 UTC**
  - **PR #51383: (sjorge) imgadm module should deal with invalid images better (refs: #51679)**
  - 2036c8a Merge pull request #51679 from Ch3LL/bp-51383
  - e4971fc imgadm module should deal with invalid images better
  - 58f2407 Merge branch '2019.2.0.rc1' into 2019.2
    - \* 6292f86 Revert "Remove custom grains module from 2018.3 branch"
    - \* 92bd6b9 Fix salt.utils.is\_windows call
    - \* ffa2f5f Merge branch '2018.3' into '2019.2'

- \* a8898f6 Merge pull request [#51635](#) from lomeroy/lgpo\_boolean\_element\_fix
  - b97c2b2 Merge branch '2018.3' into lgpo\_boolean\_element\_fix
  - 5a98fb9 Merge branch '2018.3' into lgpo\_boolean\_element\_fix
- \* abd3760 Merge pull request [#51610](#) from garethgreenaway/51266\_schedule\_enable\_disable\_break\_save
  - fbabc35 Merge branch '2018.3' into 51266\_schedule\_enable\_disable\_break\_save
- \* 6765eea Merge pull request [#51649](#) from dwoz/increase\_wait\_2018.3
  - 9c964ef Merge branch '2018.3' into increase\_wait\_2018.3
- \* 852a6be Merge pull request [#51644](#) from dwoz/batch\_exit\_2018.3
  - 1087d10 increase batch test timeout on windows
  - 918030e Increase minion wait for slow boxes
  - 3d52b26 Merge branch '2018.3' into 51266\_schedule\_enable\_disable\_break\_save
- \* dadf414 Merge pull request [#51637](#) from twangboy/backport\_50887\_2018.3
  - d8d2b86 backport [#50887](#)
- \* a55e8f6 Merge pull request [#51626](#) from twangboy/fix\_lgpo\_2018.3
  - b2c9c3b Use makedirs instead of mkdir
  - 2be2f42 Merge branch '2018.3' into 51266\_schedule\_enable\_disable\_break\_save
- \* 0f1a411 Merge pull request [#51187](#) from menglong81/fix-broken-thing
  - 298ad5c Merge branch '2018.3' into fix-broken-thing
  - d879d18 fix broken network.py
  - 76770f3 ss commmand replace to netstat command
  - 241707e ss commmand replace to netstat command
  - deefc7 Merge branch '2018.3' into 51266\_schedule\_enable\_disable\_break\_save
- \* 7ed5189 Merge pull request [#51613](#) from twangboy/fix\_51566
  - 1206a94 Merge branch '2018.3' into fix\_51566
- \* 8b06d06 Merge pull request [#51630](#) from twangboy/add\_tests\_51534
  - ddc017c Merge branch '2018.3' into add\_tests\_51534
- \* c4bbe1a Merge pull request [#51177](#) from nullify005/51069-ri-and-rdoc-removed
  - 6b1a201 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - f339608 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - e586370 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - 13d3288 Fix lint issues
  - 5de5e64 Update tests
  - 22eda16 Fix lint violations
  - 2e6252c Support rubygems 3 cli param changes
  - 9e3a01b Use existing file instead of tzutil
  - 30c1832 Use tempfile to get temp dir

- e3d3c5a Add tests for issue 51309
- 1168141 Add test for explicit lists
- 84f5d63 Merge branch '2018.3' into fix\_51566
- 7376cb9 Handle explicit lists properly
- 28fc070 Merge branch '2018.3' into 51266\_schedule\_enable\_disable\_break\_save
- 0760133 adding integration.scheduler.test\_helpers to various files to by pass the test\_module\_name\_source\_match check.
- 1552fba lint cleanup
- 086066b Adding a test to ensure \_get\_schedule which is used by the save functionality works when there is an enabled attribute.
- 1c6d4fb When looping through the schedule to remove hidden attributes, we should only do that if the item in question is a dictionary. It could be the attribute that determines if the entire scheudle is enabled or disable.
- 5ed8eb6 Properly create the value for a "True" boolean element item
- \* f1e29c8 Merge pull request #51548 from s0undt3ch/2018.3
  - 611065e Merge branch '2018.3' into 2018.3
- \* 00a6246 Merge pull request #51622 from brejoc/2018.3-empty-job-workaround
  - d263410 Prevents crash when there is no job entry
  - 5342305 Allow NOT to install pip dependencies
- \* fdb13a3 Merge pull request #51523 from lomeroe/solarisips\_fixes
  - e8e91e3 Merge branch '2018.3' into solarisips\_fixes
  - b7bfe17 lint fixes
  - cdaccf4 add tests to validate command being sent to cmd.run\_all
  - eaa229d add unit test
  - 432428d Don't assume that each item in "pkgs" is a dict (as packed by pkg.installed state).
- \* e3d5fbe Merge pull request #51577 from garethgreenaway/merge-2017.7
  - e060b97 Merge branch '2018.3' into merge-2017.7
  - 3eee038 Fixing a couple issues that did not merge properly.
  - 25b2ca6 Merge branch '2018.3' into merge-2017.7
  - c337fce Merge branch '2018.3' into merge-2017.7
  - f9d6828 Fixing missed merge.

- d7a47f0 Merge pull request #51419 from aplanas/backport\_50607
- ab8a8b8 file: update attributes for lsattr and chatter
- **PR #51414:** (aplanas) service: SUSE is not based on sysvinit anymore @ 2019-02-01 21:02:33 UTC
  - 7e020dd Merge pull request #51414 from aplanas/backport\_50396
  - b5cff17 service: SUSE is not based on sysvinit anymore
- **PR #51408:** (aplanas) parted: fix the ordering of list command @ 2019-02-01 21:00:19 UTC
  - **PR #50473:** (aplanas) parted: support variable length output for print (refs: #51408)
  - **PR #49804:** (aplanas) parted: fix the ordering of list command (refs: #51408)
  - 9f87dda Merge pull request #51408 from aplanas/backport\_49804
  - 467daf2 parted: support variable length output for print
  - da2e632 parted: fix the ordering of list command
- **ISSUE #50097:** (aplanas) lowpkg.diff refers to a package name, but a package file is required (refs: #51410)
- **PR #51410:** (aplanas) Fix lowpkg.diff documentation and parameter name @ 2019-02-01 20:57:50 UTC
  - 7e14499 Merge pull request #51410 from aplanas/backport\_50126
  - d38622e Fix lowpkg.diff documentation and parameter name
    - \* e61a077 states\_pt3: fix rST link format
- **PR #51404:** (aplanas) blockdev: fix url from comment @ 2019-01-30 20:05:54 UTC
  - a16461b Merge pull request #51404 from aplanas/backport\_49668
  - da2e30d blockdev: fix url from comment
- **PR #51407:** (aplanas) parted: fix \_validate\_partition\_boundary @ 2019-01-30 20:05:02 UTC
  - 756c367 Merge pull request #51407 from aplanas/backport\_49803
  - b004b33 parted: fix \_validate\_partition\_boundary
- **PR #51435:** (damianosSemmler) Fixed not raised exceptions @ 2019-01-30 18:32:57 UTC
  - 1d45664 Merge pull request #51435 from damianosSemmler/fix-raise-exception
  - 7a9ff59 Fixed not raised exceptions
- **PR #51336:** (Ch3LL) [2019.2] Merge Forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-27 23:55:08 UTC
  - d4b9093 Merge pull request #51336 from Ch3LL/merge-2019.2.0rc1
  - 62a20b1 Remove unused import
  - 2284ea5 Merge branch '2019.2' into merge-2019.2.0rc1
  - 18bf236 Merge branch '2019.2.0.rc1' into 2019.2
- **PR #51334:** (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-27 23:49:32 UTC
  - 02b43a0 Merge pull request #51334 from Ch3LL/merge-2019.2
  - 25ec653 Merge branch '2018.3' into '2019.2'
    - \* f62cc11 Merge pull request #51324 from garethgreenaway/1257\_something\_something\_bytes\_argh\_python2
      - bd7072f Merge branch '2018.3' into 1257\_something\_something\_bytes\_argh\_python2
    - \* b44cd84 Merge pull request #51323 from garethgreenaway/network\_dns\_check\_test

- 055eadc Merge branch '2018.3' into network\_dns\_check\_test
- \* be57a0f Merge pull request #51321 from terminalmage/issue51256
  - d9c4462 Fix 500 error when using wheel\_async
  - c847f54 Swap passed addr for string rather than ipaddress object.
  - 87f3972 removing another debugging log.
  - ad64efb Use MagicMock
  - 172ad2e removing debugging
  - 5812eae Adding a test to ensure dns\_check works as expected.
  - 0e542c5 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3
- \* 85e7ac6 Merge pull request #51306 from s0undt3ch/2018.3
  - 5f0f296 Add 2018.3 codecov config
- \* 5a398a3 Merge pull request #51207 from twangboy/fix\_test\_pkg
  - d4ab6d8 Merge branch '2018.3' into fix\_test\_pkg
- \* 7a97cb4 Merge pull request #51252 from dwoz/issue-50221
  - f96828a Merge branch '2018.3' into issue-50221
- \* 253f5e4 Merge pull request #51264 from gtmanfred/2018.3
  - f3ebd32 Merge branch '2018.3' into 2018.3
- \* aacc047 Merge pull request #51274 from twangboy/fix\_network
  - 344bf65 Fix tests. We no longer get *ipaddress* instances back.
  - 345aa5b Fix minion start issue
  - f553be7 tuples don't have pop
  - 55ea80e don't shadow builtin
  - 6148c50 an argument is not always needed to be passed to open a file
- \* 8a89cb2 Merge pull request #51279 from twangboy/backport\_lgpo
  - 06b1545 Remove network.py patch
  - 2356f25 Add `__context__` support
  - a5255f0 Merge remote-tracking branch 'saltstack/2018.3' into issue-50221
- \* 6796e65 Merge pull request #51276 from garethgreenaway/merge-2018.3
  - 44ddc43 Merge branch '2018.3' into merge-2018.3
- \* 0adde9b Merge pull request #51220 from sathieu/artifactory-classifier-2018.3
  - a85f146 fixes #31179 by applying the same logic as used in the nexus module
- \* f6a7cad Merge pull request #51225 from astronouth7303/loader-docs-2018.3
  - 6e7da95 Add the tokens system.
  - 7e2838c Add reference to the execution module docs
  - f30f9e8 Remove search system

- f0cc183 Fileserver modules can be loaded from the fileserver.
- \* 1a2f680 Merge pull request #51239 from garethgreenaway/51208\_file\_manage\_escaped\_double\_quotes
  - 4251c0c Merge branch '2018.3' into 51208\_file\_manage\_escaped\_double\_quotes
  - 6a9daa7 Merge branch '2018.3' into 51208\_file\_manage\_escaped\_double\_quotes
  - 0bf468c Fixing lint. Using a constant instead of looking for the condition in the string.
  - a233dbc Ensuring we can handle a string that contains single quote + an escaped double quote.
- \* d614127 Merge pull request #51261 from OrangeDog/patch-2
  - d809b9b Avoid double-counting errors and ignore test runs
  - 6ca7deb Remove unused host parameter and average/disaster keys
  - 2d44527 Just let zabbix\_sender use the config file
  - 6404e2c Fix fallback command so it's actually run
  - b79a55a Fix KeyError in Zabbix returner
  - 0971035 Merge branch '2018.3' into merge-2018.3
  - 243dc06 Merge branch '2017.7' into merge-2018.3
  - acfb7d8 Update pytest requirements
  - c19479b Move all of PyTest requirements to its own requirements file
  - 39e633f Merge pull request #51246 from garethgreenaway/bp-50358
  - c33c558 Backport #50358 to 2017.7
  - c1ea10f Fix py3 managed.file test failure
  - 537114c Remove un-needed log statement
  - ac978f0 Fix 50221 regression test on Windows
  - 65f38b5 preserve newlines from pillar data for file.managed
  - 464d813 Merge branch '2018.3' into fix\_test\_pkg
- \* 276d621 Merge pull request #51197 from Ch3LL/tag\_manager
  - b9a0705 Merge branch '2018.3' into tag\_manager
  - 210238b Merge branch '2018.3' into tag\_manager
  - 827d6c3 Merge branch '2018.3' into tag\_manager
  - fcdfe69 Add Google Tag Manager to Docs
- \* c8e70a9 Merge pull request #51206 from terminalmage/fix-reload
  - 8e23a6c Add missing import
  - 31ca7c6 Fix usage of reload for PY3 compatibility
- \* 41ae390 Merge pull request #51231 from terminalmage/issue51056
  - 4a61477 Clarify documentation for the the gitfs "all\_saltenvs" config param
  - 0574476 Merge branch '2018.3' into fix\_test\_pkg
  - b91b2c6 Backport PR# 50771 to 2018.3 branch

- **PR #51314:** (s0undt3ch) [2019.2] Allow running runtests.py using tox @ 2019-01-25 18:56:01 UTC
  - 95607d1 Merge pull request #51314 from s0undt3ch/features/tox-runtests-2019.2
  - 39fb981 "Tell" coverage to track subprocesses.
  - f27589a Remove unused imports
  - 3000d20 Fix tests. We no longer get *ipaddress* instances back.
  - 8fcf235 Fix minion start issue
  - a26ba7f Don't fail the test because of order
  - 138ca2e Show objects on assertion failure
  - 840b3d2 Add *pytest-salt-from-filenames* to pytest requirements
  - 716bda4 Remove duplicate dependency
  - 6d62156 Add *.coveragerc*
  - 6bb56ce Run tests from tox, wether runtests or pytest
- **PR #51307:** (s0undt3ch) Add 2019.2 codecov config @ 2019-01-24 13:34:25 UTC
  - b348034 Merge pull request #51307 from s0undt3ch/2019.2
  - 495aa5c Add 2019.2 codecov config
- **PR #51280:** (garethgreenaway) [2019.2] Merge forward from 2019.2.0rc1 to 2019.2 @ 2019-01-23 07:08:32 UTC
  - d224096 Merge pull request #51280 from garethgreenaway/merge-2019.2-rc
  - e78ede2 Merge branch '2019.2' into merge-2019.2-rc
  - a425de6 Merge branch '2019.2.0.rc1' into merge-2019.2-rc
- **PR #51277:** (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-23 07:01:29 UTC
  - 8596ee4 Merge pull request #51277 from garethgreenaway/merge-2019.2
  - f05e754 Merge branch '2019.2' into merge-2019.2
- **ISSUE #51273:** (isbm) How to properly fix API? (refs: #51285)
- **PR #51285:** (garethgreenaway) [2019.2] Add metadata to accepted keyword arguments @ 2019-01-22 23:07:44 UTC
  - 8cca51b Merge pull request #51285 from garethgreenaway/51273\_metadata\_auth\_keyword\_argument
  - bd82d80 Ensure metadata is an accepted keyword argument for authentication functions.
  - d0d5726 Merge branch '2018.3' into merge-2019.2
  - a6a9040 Merge pull request #51179 from terminalmage/fix-regex-chars
    - \* 9951b8d Fix possible oversight in nodegroup modifications
  - d5acd5b Merge pull request #51170 from dwoz/issue51158
    - \* b69c002 Fix saltmod roster test
    - \* 2594f24 Roster defines the roster system not a file
    - \* 05836b3 Merge branch '2018.3' into issue51158
    - \* bf47f6f Fix linter
    - \* 6223596 Honor roster file for ssh orchestrations

- 5543a53 Update pytest requirements
- f958df5 Move all of PyTest requirements to its own requirements file
- 8f8ebbc Merge pull request #51226 from garethgreenaway/51195\_handle\_spaces\_in\_fstab\_opts
  - \* 1902ce8 Merge branch '2018.3' into 51195\_handle\_spaces\_in\_fstab\_opts
- e3a9e99 Merge pull request #51233 from Ch3LL/bp-51105
  - \* eef49e8 Merge branch '2018.3' into bp-51105
- e53e9b1 Merge pull request #51230 from Ch3LL/merge-2018.3
  - \* 0ef7675 Merge branch '2017.7' into '2018.3'
  - \* 4a12c5f Merge pull request #50852 from mirceaulinic/fix-capirca
    - fa91267 Merge branch '2017.7' into fix-capirca
    - 71913ff Merge branch '2017.7' into fix-capirca
    - 6fc3484 Lint?
    - 3d56750 Extra newline for lint
    - 5176cd8 Improve the Capirca and related modules for ACL config generation
  - \* 3f4759b Merge pull request #50923 from astronouth7303/patch-2
    - 4f631a6 Document {% include %}
  - \* 210e817 Merge pull request #51111 from s0undt3ch/2017.7
    - 08e0ae7 Update to salt-bootstrap v2019.01.08
    - c3520aa Accounting for when permissions are not returned from file.check\_perms, eg. windows systems.
    - cd80548 When test=True and there are permissions changes, report it.
    - 89345eb Handle spaces in fstab opts, similar fix to #39593
  - **ISSUE #50538:** (sjorge) salt.modules.pdbedit broken on Samba 4.9.x (refs: #50540, #51221)
  - **PR #51221:** (Ch3LL) Backport #50538 into 2019.2 @ 2019-01-18 22:42:36 UTC
    - **PR #50540:** (sjorge) Fix pdbedit module on samba 4.9 (Fixes #50538)
    - 0ccd5c3 Merge pull request #51221 from Ch3LL/bp-50540
    - 223e7c0 Merge branch '2019.2' into bp-50540
  - **PR #51232:** (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-18 20:51:37 UTC
    - 3edaf18 Merge pull request #51232 from Ch3LL/merge-2019.2
    - 3b966f3 Merge branch '2019.2' into merge-2019.2
    - ffe23fa Merge branch '2018.3' into '2019.2'
      - \* 26008ef Merge pull request #51212 from sathieu/file\_roots\_slash
        - b769f18 Allow slash in file\_roots envs
        - f9437e2 Test for file\_roots envs with slash leads to "No such file or directory"
      - \* 5916282 Merge pull request #51209 from garethgreenaway/bp-51124
        - 82acce4 Handle encoding when opening file for both py2/py3

- \* 094bd33 Merge pull request #51184 from twangboy/fix\_auditpol
  - 2e68d35 directly call cmd.run\_all
- \* ac71922 Merge pull request #51191 from Ch3LL/bp-50918
  - 7300d84 Skip debian tests on Windows
  - 4622433 Fix *test\_debian\_ip* on Windows
- \* e7f53a3 Merge pull request #51144 from jgleissner/2018.3-azurearm-py3
  - 3178f1a msazure.py: remove unused imports
  - 99a4b9d azurearm: fix list\_locations
  - aebe34b azurearm: fix show\_instance function
  - d80669f msazure: fix object\_to\_dict for python 3
- \* 1206f92 Merge pull request #51171 from twangboy/fix\_crypt
  - 6caa93b Add random sleep time to avoid overloading Windows
- \* a96deed Merge pull request #51174 from jpsv/2018.3
  - 055823e Update opsgenie.py
  - 501c8df Merge branch '2018.3' into 2018.3
  - 220aa8a Update opsgenie.py
  - 5dc21cc Update to from V1 API to V2
  - f93ce7c Update to V2 API
- \* 563d487 Merge pull request #51010 from amendlik/ldap-groups
  - cd336ed Merge branch '2018.3' into ldap-groups

- \* 9386aab Merge branch '2017.7' into merge-2018.3
- \* 998feca Merge pull request #51030 from terminalmage/issue38502
- \* 6dbd81f Add unit test to ensure we don't diff bare repos
- \* 3c4b243 Merge branch '2019.2' into bp-50540
- **PR #51234:** (KChandrashekhhar) Added a note in Release notes about py 2.7 EOL @ 2019-01-18 15:53:51 UTC
  - e6ab913 Merge pull request #51234 from KChandrashekhhar/2019.2-docs
  - e4afc81 Addressing Megan's comment to fix the py2.7 deprecation message in release notes
  - 8ec0296 Added a note in Release notes about py 2.7 EOL
- **PR #51198:** (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-17 21:23:34 UTC
  - 644ef8c Merge pull request #51198 from Ch3LL/merge-2019.2-rc
  - 810c611 Merge branch '2019.2.0.rc1' into 2019.2
  - 3f61e77 Fix pdbedit module on samba 4.9 (Fixes #50538)
- **PR #51148:** (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-14 22:49:02 UTC
  - 12901c3 Merge pull request #51148 from Ch3LL/merge-2019.2
  - 1d7329a Fix pylint
  - 5271636 Fixes mysql server version comparison.

- b53f171 Ensure kwargs is a list before we attempt to loop through. Similar fix to <https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6> in the proxy module.
- d0f2d15 Revert add -> check
- 437d8b5 Typos in index\_template\_present documentation
- 3bf189e Add unit test to ensure we don't diff bare repos
- 2f8e391 Fix profile outputter docs
- **PR #51100:** (dwoz) Fix typo in method name (2019.2) @ 2019-01-08 18:12:23 UTC
  - 4c2d76d Merge pull request #51100 from dwoz/cloud\_typo
  - 60f53d0 Fix typo in method name
- **PR #51099:** (terminalmage) Fix improper exception raises (2019.2) @ 2019-01-08 17:55:53 UTC
  - 39b28f4 Merge pull request #51099 from terminalmage/fix-exception-raise
  - 2a25530 Fix improper exception raise
- **PR #51084:** (s0undt3ch) [fluorine] Cleanup the singleton instances map. @ 2019-01-07 22:03:29 UTC
  - 8827193 Merge pull request #51084 from s0undt3ch/merge-singleton-last-ref-close-fluorine
  - 979fbac Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - 63f051a Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - bd6c46d Cleanup the singleton instances map.

### 28.2.3 Salt 2019.2.2 Release Notes

Version 2019.2.2 is a bugfix release for *2019.2.0*.

#### Statistics

- Total Merges: 20
- Total Issue References: 11
- Total PR References: 20
- Contributors: 12 (Akm0d, Ch3LL, Oloremo, OrlandoArcapix, bryceml, dhiltonp, dwoz, frogunder, gareth-greenaway, javierbertoli, pizzapanther, s0undt3ch)

#### Changelog for v2019.2.1..v2019.2.2

Generated at: 2019-10-02 18:33:46 UTC

- **PR #54852:** (frogunder) Update man pages for 2019.2.2 @ 2019-10-02 18:27:07 UTC
  - 10d433f Merge pull request #54852 from frogunder/man\_pages\_2019.2.2
  - 92bc4b2 Update man pages for 2019.2.2
- **PR #54845:** (s0undt3ch) Remove debug print @ 2019-10-02 17:38:21 UTC
  - 8ca6b20 Merge pull request #54845 from s0undt3ch/hotfix/event-return-fix-2019.2.1
  - 3937890 Remove debug print

- **ISSUE #54755:** (Reiner030) 2019.2.1/2019.2.0 pip failures even when not using pip (refs: #54826)
- **PR #54826:** (dwoz) Fix issue 54755 and add regression tests @ 2019-10-01 20:07:46 UTC
  - 9e3914a Merge pull request #54826 from dwoz/issue\_54755
  - 0bad9cb Handle locals and globals separately
  - bcbe9a2 Only purge pip when needed
  - d2f98ca Fix issue 54755 and add regression tests
- **PR #54830:** (frogunder) Add known issues to 2019.2.1 release notes @ 2019-10-01 16:23:30 UTC
  - ba569d0 Merge pull request #54830 from frogunder/update\_relasenotes\_2019.2.1
  - 8cdb27b Update 2019.2.1.rst
  - 14f955c Add known issues to 2019.2.1 release notes
- **ISSUE #54521:** (Oloremo) [Regression] Failhard, batch and retcodes (refs: #54806)
- **PR #54806:** (Oloremo) [Regression] Batch with failhard fix @ 2019-10-01 14:51:47 UTC
  - 433b6fa Merge pull request #54806 from Oloremo/failhard-batch-fix-2019.2.1
  - 6684793 Merge branch '2019.2.1' into failhard-batch-fix-2019.2.1
  - 3e0e928 Added tests for cli and runner
  - 2416516 Made batch work properly with failhard in cli and runner
- **ISSUE #54820:** (OrangeDog) schedule.present not idempotent when scheduler disabled (refs: #54828)
- **PR #54828:** (garethgreenaway) [2019.2.1] Fix global disabling code in scheduler @ 2019-10-01 09:27:49 UTC
  - ed94aa5 Merge pull request #54828 from garethgreenaway/54820\_fix\_schedule\_disabled\_job\_enabled\_bug
  - be15a28 Rework code that handles individual jobs being disabled and scheduler being globally being disabled. Previously disabling the schedule would result in individual jobs being disabled when they were run through eval. This change does not change schedule items.
- **PR #54778:** (Akm0d) fix broken salt-cloud openstack query @ 2019-10-01 09:23:27 UTC
  - 435b40c Merge pull request #54778 from Akm0d/master\_openstack\_query\_fix
  - ba4ba2a fixed pylint errors in openstack test
  - d9a8517 Added openstack tests for openstack -query fix
  - 59214ad Fallback to image id if we don't have an image name
  - 3a42a4d fixed pylint error
  - 0074d18 created unit tests for openstack
  - 4255e3e Merge branch '2019.2.1' of <https://github.com/saltstack/salt> into HEAD
  - 1c2821b Return a configured provider, not a bool
  - c585550 fix broken salt-cloud openstack query
- **ISSUE #54762:** (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54807, #54784, #54823)
- **PR #54823:** (dhiltonp) ip\_bracket can now accept ipv6 addresses with brackets @ 2019-10-01 01:13:34 UTC
  - 93b1c4d Merge pull request #54823 from dhiltonp/maybe-bracket
  - faa1d98 ip\_bracket can now accept ipv6 addresses with brackets
- **ISSUE #54762:** (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54807, #54784, #54823)

- **PR #54807:** (dwoz) Fix pip state pip  $\geq 10.0$  and  $\leq 18.0$  @ 2019-09-30 09:20:14 UTC
  - **PR #54772:** (OrlandoArcapix) Fix import of pip modules (refs: #54807)
  - b61b30d Merge pull request #54807 from dwoz/patch-2
  - 664806b Add unit test for pip state fix
  - e637658 Revert change to pip version query
  - 42810a2 Fix import of pip modules
- **ISSUE #54741:** (kjkneane) Schedulers Fail to Run (refs: #54799)
- **PR #54799:** (garethgreenaway) Fix to scheduler when job without a time element is run with schedule.run\_job @ 2019-09-30 00:19:43 UTC
  - 4ee1ff6 Merge pull request #54799 from garethgreenaway/54741\_run\_job\_fails\_without\_time\_element
  - 44caa81 Merge branch '54741\_run\_job\_fails\_without\_time\_element' of github.com:garethgreenaway/salt into 54741\_run\_job\_fails\_without\_time\_element
    - \* 3ae4f75 Merge branch '2019.2.1' into 54741\_run\_job\_fails\_without\_time\_element
  - 8afd2d8 Removing extra, unnecessary code.
  - 549cfb8 Fixing test\_run\_job test to ensure the right data is being asserted. Updating unit/test\_module\_names.py to include integration.scheduler.test\_run\_job.
  - 7d716d6 Fixing lint.
  - ec68591 If a scheduled job does not contains a time element parameter then running that job with schedule.run\_job fails with a traceback because data['run'] does not exist.
- **PR #54785:** (Ch3LL) Fix state.show\_states when sls file missing in top file @ 2019-09-30 00:00:34 UTC
  - b90c3f2 Merge pull request #54785 from Ch3LL/fix\_show\_states
  - 96540be Clean up files after state.show\_states test
  - ad265ae Fix state.show\_states when sls file missing
- **ISSUE #54768:** (paul-palmer) 2019.2.1 Some Jinja imports not found (refs: #54780)
- **ISSUE #54765:** (awerner) 2019.2.1: Jinja from import broken (refs: #54780)
- **PR #54780:** (dwoz) Fix masterless jinja imports @ 2019-09-29 22:12:48 UTC
  - b9459e6 Merge pull request #54780 from dwoz/fix-masterless-jinja-imports
  - 5d873cc Merge branch '2019.2.1' into fix-masterless-jinja-imports
  - e901a83 Add regression tests for jinja import bug
  - 3925bb7 Fix broken jinja imports in masterless salt-call
- **ISSUE #54776:** (javierbertoli) Setting ping\_interval in salt-minion's config (version 2019.2.1) prevents it from starting (refs: #54777)
- **PR #54777:** (javierbertoli) Fix minion's remove\_periodic\_callback() @ 2019-09-29 21:33:53 UTC
  - 4c240e5 Merge pull request #54777 from netmanagers/2019.2.1
  - 459c790 Merge branch '2019.2.1' into 2019.2.1
- **PR #54805:** (bryceml) improve lint job @ 2019-09-29 21:24:05 UTC
  - 83f8f5c Merge pull request #54805 from bryceml/2019.2.1\_update\_lint\_salt
  - ffa4ed6 improve lint job

- fa1a767 Merge branch '2019.2.1' into 2019.2.1
- **ISSUE #54751:** (jnmattlock) NXOS\_API Proxy Minions Error KeyError: 'proxy.post\_master\_init' after upgrading to 2019.2.1 (refs: #54783)
- **PR #54783:** (garethgreenaway) Ensure metaproxy directory is included in sdist @ 2019-09-29 02:17:23 UTC
  - 6b43f8e Merge pull request #54783 from garethgreenaway/54751\_fixing\_missing\_metaproxy\_directory
  - 67d9938 Merge branch '2019.2.1' into 54751\_fixing\_missing\_metaproxy\_directory
  - a35e609 Adding \_\_init\_\_.py to metaproxy directory so that metaproxy is included when running setup.py.
- **ISSUE #54762:** (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54807, #54784, #54823)
- **PR #54784:** (dhiltonp) fix dns\_check to return uri-compatible ipv6 addresses, add tests @ 2019-09-28 08:36:51 UTC
  - 7912b67 Merge pull request #54784 from dhiltonp/ipv6
  - 042a101 Merge branch '2019.2.1' into ipv6
- **PR #54779:** (frogunder) Add 2019.2.2 release notes @ 2019-09-27 17:45:46 UTC
  - 2f94b44 Merge pull request #54779 from frogunder/releasenotes\_2019.2.2
  - 67f564b Add 2019.2.2 release notes
  - ac6b54f Merge branch '2019.2.1' into ipv6
  - 93ebd09 update mock (py2) from 2.0.0 to 3.0.5
  - 37bcc4c fix dns\_check to return uri-compatible ipv6 addresses, add tests
    - \* dd86c46 Merge pull request #1 from waynew/pull/54777-callback-typo
      - a57f7d0 Add tests
    - \* c19d0b0 Fix minion's remove\_periodic\_callback()
- **PR #54731:** (pizzapanther) Fix returners not loading properly @ 2019-09-26 17:24:27 UTC
  - 46bec3c Merge pull request #54731 from pizzapanther/not-so-\_\_new\_\_-and-shiny
  - bdf24f4 Make sure we tests salt-master's event\_return setting
  - 5499518 remove unnecessary import
  - 3f8a382 fix module import
  - 0746aa7 remove \_\_new\_\_ method since it was removed from parent class
- **PR #54706:** (bryceml) 2019.2.1 ruby @ 2019-09-23 16:00:27 UTC
  - e2b86bf Merge pull request #54706 from bryceml/2019.2.1\_ruby
  - 168a6c1 switch to ruby 2.6.3

## 28.2.4 Salt 2018.3.0 Release Notes - Codename Oxygen

**Warning:** If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
file.manged:
- source: salt://foo.conf
- template: jinja
- defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own `json` or `yaml` filters:

```
/etc/foo.conf:
file.manged:
- source: salt://foo.conf
- template: jinja
- defaults: {{ mydict | json }}
```

### Unicode/Python 3 Compatibility Improvements

This release fixes a number of nagging issues with Unicode strings in Salt under Python 2 (ex. `'ascii' codec can't decode byte 0xd0`). For best results, use a UTF-8 locale (such as by setting the `LANG` environment variable to one which supports UTF-8. For example `en_US.UTF-8`, `de_DE.UTF-8`, `ru_RU.UTF-8`, `C.UTF-8`).

Additionally, a number of Python 3 compatibility fixes have been made, many of them having to do with file I/O and `str/bytes` mismatches.

We continue to work toward improving both Unicode and Python 3 compatibility and welcome any feedback.

### Lots of Docker Improvements

#### Much Improved Support for Docker Networking

The `docker_network.present` state has undergone a full rewrite, which includes the following improvements:

#### Full API Support for Network Management

The improvements made to input handling in the `docker_container.running` state for 2017.7.0 have now been expanded to `docker_network.present`. This brings with it full support for all tunable configuration arguments.

#### Custom Subnets

Custom subnets can now be configured. Both IPv4 and mixed IPv4/IPv6 networks are supported. See [here](#) for more information.

#### Network Configuration in `docker_container.running` States

A long-requested feature has finally been added! It is now possible to configure static IPv4/IPv6 addresses, as well as links and labels. See [here](#) for more information.

---

**Note:** While the `containers` argument to `docker_network.present` will continue to be supported, it will no longer be the recommended way of ensuring that a container is attached to a network.

---

### Improved Handling of Images from Custom Registries

Rather than attempting to parse the tag from the passed image name, Salt will now resolve that tag down to an image ID and use that ID instead.

---

**Important:** Due to this change, there are some backward-incompatible changes to image management. See below for a full list of these changes.

---

### Backward-incompatible Changes to Docker Image Management

Passing image names to the following functions must now be done using separate `repository` and `tag` arguments:

- `docker.build`
- `docker.commit`
- `docker.import`
- `docker.load`
- `docker.tag`
- `docker.sls_build`

Additionally, the `tag` argument must now be explicitly passed to the `docker_image.present` state, unless the image is being pulled from a docker registry.

### State and Execution Module Support for `docker run` Functionality

The `docker_container.running` state is good for containers which run services, but it is not as useful for cases in which the container only needs to run once. The `start` argument to `docker_container.running` can be set to `False` to prevent the container from being started again on a subsequent run, but for many use cases this is not sufficient. Therefore, the `docker.run_container` remote-execution function was added. When used on the Salt CLI, it will return information about the container, such as its name, ID, exit code, and any output it produces.

State support has also been added via the `docker_container.run` state. This state is modeled after the `cmd.run` state, and includes arguments like `onlyif`, `unless`, and `creates` to control whether or not the container is run.

### Full API Support for `docker.logs`

This function now supports all of the functions that its Docker API counterpart does, allowing you to do things like include timestamps, and also suppress `stdout/stderr`, etc. in the return.

### *start* Argument Added to `docker.create` Function

This removes the need to run `docker.start` separately when creating containers on the Salt CLI.

```
salt myminion docker.create image=foo/bar:baz command=/path/to/command start=True
```

### Use SaltSSH Minions like regular Master-Minions

The Master process can now also call SSH minions as if they were connected to the master using ZeroMQ. By setting `enable_ssh_minions: True` in the master config file, the master will create a Salt SSH client process which connects to the minion and returns the output for the `salt` CLI to use like a regular minion. This can be used anywhere the `LocalClient` is used.

### Exceptions Raised for Authentication/Authorization Errors

When sending `publish` commands via `master.py` and `masterapi.py` and an authorization or authentication problem is encountered, Salt will now raise the appropriate exceptions instead of returning an empty string: `''`.

The reasoning behind this change is to make it easier to debug various scenarios surrounding authentication and authorization issues more effectively.

### Comparison Operators in Package Installation

Salt now supports using comparison operators (e.g. `>=1.2.3`) when installing packages on minions which use `yum/dnf` or `apt`. This is supported both in the `pkg.installed` state and in the `pkg.install` remote execution function.

### Master Tops Changes

When both *Master Tops* and a *Top File* produce SLS matches for a given minion, the matches were being merged in an unpredictable manner which did not preserve ordering. This has been changed. The top file matches now execute in the expected order, followed by any master tops matches that are not matched via a top file.

To make master tops matches execute first, followed by top file matches, set the new `master_tops_first` minion config option to `True`.

### Several Jinja Filters Renamed

The following Jinja filters (originally added in 2017.7.0) have been renamed due to the fact that they were inaccurately named when initially added. The original names will be supported until the Neon release of Salt.

- `rand_str` renamed to `random_hash`
- `jinja_decode_dict` renamed to `jinja_encode_dict`
- `jinja_decode_list` renamed to `jinja_encode_list`

## Return Codes for Runner/Wheel Functions

When using *orchestration*, runner and wheel functions used to report a `True` result if the function ran to completion without raising an exception. It is now possible to set a return code in the `__context__` dictionary, allowing runner and wheel functions to report that they failed. Here's some example pseudocode:

```
def myrunner():
 ...
 do stuff
 ...
 if some_error_condition:
 __context__['retcode'] = 1
 return result
```

## Variable Update Intervals for Fileserver Backends

Prior to this release, fileservers would be updated as part of a dedicated "maintenance" process, in which various routine maintenance tasks were performed. This tied the update interval to the *loop\_interval* config option, and also forced all fileservers to update at the same interval.

2018.3.0 adds the following configuration options for the various fileserver backends:

- *roots\_update\_interval*
- *azurefs\_update\_interval*
- *gitfs\_update\_interval*
- *hgfs\_update\_interval*
- *minionfs\_update\_interval*
- *s3fs\_update\_interval*
- *svnfs\_update\_interval*

These allow for update intervals to be set for each individual backend. The default value for each of these is 60 seconds.

In addition, for *GitFS* it is also possible to apply intervals to individual remotes. See [here](#) for examples.

---

**Note:** `git_pillar` does not yet support variable update intervals, this is targeted for the next feature release (2019.2.0).

---

## LDAP via External Authentication Changes

In this release of Salt, if LDAP Bind Credentials are supplied, then these credentials will be used for all LDAP access except the first authentication when a job is submitted. The first authentication will use the user's credentials as passed on the CLI. This behavior is to accommodate certain two-factor authentication schemes where the authentication token can only be used once.

In previous releases the bind credentials would only be used to determine the LDAP user's existence and group membership. The user's LDAP credentials were used from then on.

## Stormpath External Authentication Removed

Per Stormpath's announcement, their API will be shutting down on 8/17/2017 at noon PST so the Stormpath external authentication module has been removed.

<https://stormpath.com/oktaplusstormpath>

## New (Proxy) Minion Configuration Options

To be able to connect the Minion to the Master using a certain source IP address or port, the following options have been added:

- `source_interface_name`
- `source_address`
- `source_ret_port`
- `source_publish_port`

## environment config option renamed to saltenv

The `environment` config option predates referring to a salt fileserver environment as a `saltenv`. To pin a minion to a single environment for running states, one would use `environment`, but overriding that environment would be done with the `saltenv` argument. For consistency, `environment` is now simply referred to as `saltenv`. There are no plans to deprecate or remove `environment`, if used it will log a warning and its value will be used as `saltenv`.

## lock\_saltenv config option added

If set to `True`, this option will prevent a minion from allowing the `saltenv` argument to override the value set in `saltenv` when running states.

## Failed Minions for State/Function Orchestration Jobs Added to Changes Dictionary

For orchestration jobs which run states (or run remote execution functions and also use a `fail function` to indicate success or failure), minions which have `False` results were previously included as a formatted string in the comment field of the return for that orchestration job. This made the failed returns difficult to *parse programatically*. The failed returns in these cases are now included in the changes dictionary, making for much easier parsing.

## Grains

- `fc_wwn` - Show all fibre channel world wide port names for a host, must be enabled with `fibre_channel_grains`
- `iscsi_iqn` - Show the iSCSI IQN name for a host
- `swap_total` - Show the configured `swap_total` for Linux, \*BSD, OS X and Solaris/SunOS
- `virtual`:
  - identifies reports KVM and VMM hypervisors when running an OpenBSD guest
  - for detecting Solaris Logical Domains (LDMs) running on T-Series SPARC hardware. The `virtual_subtype` grain is populated as a list of domain roles.

## Salt Minion Auto-discovery

Using auto-discovery, the Salt Minion now no longer needs to be configured against a specific DNS name or IP address of a Master.

For this feature Salt Master now requires port 4520 for UDP broadcast packets to be opened and the Salt Minion be able to send UDP packets to the same port.

### Configuration

By default, automatic discovery is disabled.

**Warning:** Due to the current limitations that will be changing in a future release, before you turn on auto-discovery, make sure your network is secured and trusted.

Auto-discovery is configured on Master and Minion. Both of them are configured via the `discovery` option as follows:

#### Master configuration

To use the default configuration, which accepts any minion, simply set `discovery` to `True`:

```
discovery: true
```

A sub-option called *mapping* allows auto-discovery to help find the proper Master. The mapping contains an arbitrary set of key/value pairs, which the Minion configuration can target. By default, no mappings are set.

Example:

```
discovery:
 mapping:
 description: SES 5.0
 node: 1
```

It is also possible to change the port used from the default of 4520, by setting a `port` option under the Master's `discovery` configuration:

```
discovery:
 port: 4567
```

---

**Note:** When using a port number other than the default, the Minion's `discovery` configuration must *also* have a port specified, otherwise the Minion will still attempt to contact the Master on port 4520.

---

#### Minion configuration

In addition to the `mapping` and `port` options, the following additional options are available to Minions:

- `attempts` - This option specifies how many broadcast requests should be sent to the network, waiting for any Master response. Each attempt takes a couple of seconds, so raising this value may result in a slower Minion startup. Note that, on a properly-configured network, autodiscovery should succeed on the first attempt. By default, this value is set to 3.
- `match` - This option can be set to either `all` or `any`, and it determines how the values configured in `mapping` are matched. If set to `all`, then all of the key/value pairs in the Minion's `mapping` must match a given Master. If set to `any` (the default), then any match to a key/value mapping will constitute a match.

- `pause` - The interval in seconds between attempts (default: 5).
- `fibre_channel_grains` - Enables the `fc_wwn` grain. (Default: False)
- `iscsi_grains` - Enables the `iscsi_iqn` grain. (Default: False)

### Connection to a type instead of DNS

By now each Minion was connecting to a Master by DNS or IP address. From now on it is possible also to connect to a `_type_` of a Master. For example, in a network there are three different Masters, each corresponds for a particular niche or environment or specific role etc. The Minion is supposed to connect only to one of those Masters that is described appropriately.

To achieve such an effect, each `/etc/salt/master` configuration should have a `discovery` option, which should have a `mapping` element with arbitrary key/value pairs. The same configuration should be on the Minion, so then when mapping matches, Minion recognises Master as its connection target.

Example for Master configuration (`/etc/salt/master`):

```
discovery:
 mapping:
 description: SES 5.0
 node: 1
```

The example above describes a system that is running a particular product, where `description` is an arbitrary key and `SES 5.0` is just a string. In order to match exactly this Master, the following configuration at Minion should be present:

```
discovery:
 match: all # Can be "all" or "any"
 mapping:
 description: SES 5.0
 node: 1
```

Notice `match` criteria is set to `all`. This would mean that from all found Masters select only that, which `description` is set to `SES 5.0` and `node` is set to `1`. All other Masters will be ignored.

### Limitations

This feature has a couple of `_temporary_` limitations that are subject to change in the future:

- Only one Master on the network is supported. Currently the Minion cannot select which Master out of few the same to choose. This will change to choosing the Master that is least loaded.
- Minions will accept `_any_` master that matches connection criteria without any particular security applied (priv/pub key check, signature, fingerprint etc). That implies that administrator is expected to know his network and make sure it is clean.

### New Modules

- `salt.modules.purefa`

### New NaCl Renderer

A new renderer has been added for encrypted data.

### New support for Cisco UCS Chassis

The salt proxy minion now allows for control of Cisco USC chassis. See the `cimc` modules for details.

### New support for Cassandra v3

The `cassandra_cql` module now supports Cassandra v3 which has changed its internal schema to define keyspaces and columns.

### New salt-ssh roster

A new roster has been added that allows users to pull in a list of hosts for salt-ssh targeting from a `~/ .ssh` configuration. For full details, please see the `sshconfig` roster.

### New GitFS Features

Two new features which affect how GitFS maps branches/tags to fileservers environments (i.e. `saltenvs`) have been added:

1. It is now possible to completely turn off Salt's default mapping logic (aside from the mapping of the base `saltenv`). This can be triggered using the new `gitfs_disable_saltenv_mapping` config option.

---

**Note:** When this is disabled, only the base `saltenv` and any configured using *per-saltenv configuration parameters* will be available.

---

2. The types of refs which Salt will use as `saltenvs` can now be controlled. In previous releases, branches and tags were both mapped as environments, and individual commit SHAs could be specified as `saltenvs` in states (and when caching files using `cp.cache_file`). Using the new `gitfs_ref_types` config option, the types of refs which are used as `saltenvs` can be restricted. This makes it possible to ignore all tags and use branches only, and also to keep SHAs from being made available as `saltenvs`.

### Additional output modes

The `state_output` parameter now supports `full_id`, `changes_id` and `terse_id`. Just like `mixed_id`, these use the state ID as name in the highstate output. For more information on these output modes, see the docs for the *Highstate Outputter*.

### Windows

#### Python Version

Python 2 Windows API was design when Windows did not support Unicode. Windows now supports Unicode however to keep backwards compatibility Python 2 Windows API has not been changed. Python 3 Windows API supports Unicode. Salt Python 3 installer is the recommend choice for users who need characters other than Non-ASCII (7bit) characters.

## pkg Execution module changes

Significant changes have been made to the `win_pkg` execution module. Users should test this release against their existing package sls definition files. These changes are also in 2016.11.9 & 2017.7.3.

- `pkg.list_available` no longer defaults to refreshing the winrepo meta database.
- `pkg.install` without a `version` parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` or in a state use `pkg.latest` to get the old behavior.
- `pkg.list_pkgs` now returns multiple versions if software installed more than once.
- `pkg.list_pkgs` now returns 'Not Found' when the version is not found instead of '(value not set)' which matches the contents of the sls definitions.
- `pkg.remove()` will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- `pkg.remove()` can remove `latest` software, if `latest` is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with `cmd.exe` shell and `cmdmod` is called with a command line string instead of a list. Some sls files in `saltstack/salt-winrepo-ng` expected the commands to be prefixed with `cmd.exe` (i.e. the use of `&`).
- Some execution module functions results, now behaviour more like their Unix/Linux versions.

## Installer

### Changes to config handling

Behavior with existing configuration has changed. With previous windows installers the existing config was used and the master and minion id could be modified via the installer. It was problematic in that it didn't account for configuration that may be defined in the `minion.d` directory. This change gives you the option via a drop-down list to use one of the following:

- **Default Config:** Use the config that comes with the installer
- **Existing Config:** Use the current config without changes
- **Custom Config:** Select a custom config using the file picker

The existing config option will only be available if the installer detects an existing config. If there is an existing config, and you choose **Default** or **Custom**, the existing config will be deleted, including the `minion.d` directory, and replaced by your selection.

The **Default Config** and **Custom Config** options will allow you to modify the Master and the Minion ID. **Existing Config** will leave the existing configuration unchanged.

These settings can be defined on the command line using the following switches:

- `/default-config`
- `/custom-config=C:\Path\To\Custom\Config\minion`

If neither option is passed and there is an existing config, the default is to use the existing config. If there is no existing config (new install) the default config will be used.

## Multi-master configuration

The installer now has the ability to apply a multi-master configuration either from the GUI or the command line. The `master` field in the GUI can accept either a single master or a comma-separated list of masters. The command-line switch (`/master=`) can accept the same.

## Command-line help

The Windows installer will now display command-line help when a help switch (`/?`) is passed.

## New utils module `salt.utils.pkg.win`

A new utils module has been added, which gathers information about windows installed software. This is currently not used by any salt execution module or state at this time. Users are encouraged to run this and report any issues. Running the command with the `detail` option will be useful for anyone developing windows package definitions. With salt installed in the default location the following command will print the help message.

```
chcp 65001
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py detail
↪system
```

## Salt Cloud Features

### OpenStack Revamp

The OpenStack Driver has been rewritten mostly from scratch. Salt is now using the *shade driver* <<https://docs.openstack.org/shade/latest/>>.

With this, the nova driver is being deprecated.

*openstack driver*

There have also been several new modules and states added for managing OpenStack setups using shade as well.

*keystone keystone role grant keystone group keystone role keystone service keystone user keystone domain keystone project keystone endpoint glance glance\_image neutron neutron subnet neutron secgroup neutron secgroup rule neutron network*

### Pre-Flight Commands

Support has been added for specified "preflight commands" to run on a VM before the deploy script is run. These must be defined as a list in a cloud configuration file. For example:

```
my-cloud-profile:
 provider: linode-config
 image: Ubuntu 16.04 LTS
 size: Linode 2048
 preflight_cmds:
 - whoami
 - echo 'hello world!'
```

These commands will run in sequence **before** the bootstrap script is executed.

### New salt-cloud Grains

When salt-cloud creates a new minion, it will now add grain information to the minion configuration file, identifying the resources originally used to create it.

The generated grain information will appear similar to:

```
grains:
 salt-cloud:
 driver: ec2
 provider: my_ec2:ec2
 profile: ec2-web
```

The generation of salt-cloud grains can be suppressed by the option `enable_cloud_grains: 'False'` in the cloud configuration file.

### Upgraded Saltify Driver

The salt-cloud Saltify driver is used to provision machines which are not controlled by a dedicated cloud supervisor (such as typical hardware machines) by pushing a salt-bootstrap command to them and accepting them on the salt master. Creation of a node has been its only function and no other salt-cloud commands were implemented.

With this upgrade, it can use the salt-api to provide advanced control, such as rebooting a machine, querying it along with conventional cloud minions, and, ultimately, disconnecting it from its master.

After disconnection from ("destroying" on) one master, a machine can be re-purposed by connecting to ("creating" on) a subsequent master.

### New Vagrant Driver

The salt-cloud Vagrant driver brings virtual machines running in a limited environment, such as a programmer's workstation, under salt-cloud control. This can be useful for experimentation, instruction, or testing salt configurations.

Using salt-api on the master, and a salt-minion running on the host computer, the Vagrant driver can create (`vagrant up`), restart (`vagrant reload`), and destroy (`vagrant destroy`) VMs, as controlled by salt-cloud profiles which designate a `Vagrantfile` on the host machine.

The master can be a very limited machine, such as a Raspberry Pi, or a small VagrantBox VM.

### Python PyWinRM Module

Versions of `pywinrm`  $\geq 0.2.1$  are finally able to disable validation of self signed certificates. [Here](#) for more information.

### DigitalOcean

The DigitalOcean driver has been renamed to conform to the company name. The new driver name is `digitalocean`. The old name `digital_ocean` and a short one `do` will still be supported through virtual aliases, this is mostly cosmetic.

## Azure Cloud

The azure sdk used for the azurearm cloud driver now depends on `azure-cli>=2.0.12`

## New `saltclass` pillar/master\_tops modules

This module clones the behaviour of `reclass` (<http://reclass.pantsfullofunix.net/>), without the need of an external app, and add several features to improve flexibility. `Saltclass` lets you define your nodes from simple `yaml` files (`.yaml`) through hierarchical class inheritance with the possibility to override pillars down the tree.

### Features

- Define your nodes through hierarchical class inheritance
- Reuse your `reclass` data with minimal modifications
  - `applications => states`
  - `parameters => pillars`
- Use Jinja templating in your `yaml` definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using `^` character (see examples)
- Expand variables `$$` with possibility to escape them if needed `$$$` (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of data is available here: <http://git.mauras.ch/salt/saltclass/src/master/examples>

| Terms usable in <code>yaml</code> files | Description                                                                                  |
|-----------------------------------------|----------------------------------------------------------------------------------------------|
| <code>classes</code>                    | A list of classes that will be processed in order                                            |
| <code>states</code>                     | A list of states that will be returned by <code>master_tops</code> function                  |
| <code>pillars</code>                    | A <code>yaml</code> dictionary that will be returned by the <code>ext_pillar</code> function |
| <code>environment</code>                | Node <code>saltenv</code> that will be used by <code>master_tops</code>                      |

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.

### Class Names

Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

### Saltclass Tree

A saltclass tree would look like this:

### Examples

`<saltclass_path>/nodes/lausanne/qls.node1.yml`

```

environment: base

classes:
{% for class in ['default'] %}
- {{ class }}
{% endfor %}
- subsidiaries.{{ __grains__['id'].split('.')[0] }}

```

`<saltclass_path>/classes/default/init.yml`

```
classes:
- default.users
- default.motd

states:
- openssh

pillars:
 default:
 network:
 dns:
 srv1: 192.168.0.1
 srv2: 192.168.0.2
 domain: example.com
 ntp:
 srv1: 192.168.10.10
 srv2: 192.168.10.20
```

<saltclass\_path>/classes/subsidiaries/gnv.yml

```
pillars:
 default:
 network:
 sub: Geneva
 dns:
 srv1: 10.20.0.1
 srv2: 10.20.0.2
 srv3: 192.168.1.1
 domain: gnv.example.com
 users:
 adm1:
 uid: 1210
 gid: 1210
 gecos: 'Super user admin1'
 homedir: /srv/app/adm1
 adm3:
 uid: 1203
 gid: 1203
 gecos: 'Super user adm
```

Variable expansions:

Escaped variables are rendered as is - `-${test}`

Missing variables are rendered as is - `-${net:dns:srv2}`

```
pillars:
 app:
 config:
 dns:
 srv1: ${default:network:dns:srv1}
 srv2: ${net:dns:srv2}
 uri: https://application.domain/call?${test}
 prod_parameters:
 - p1
 - p2
 - p3
 pkg:
```

(continues on next page)

(continued from previous page)

- ```
- app-core
- app-backend
```

List override:

Not using `^` as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `'${xx}'` will stay as is instead of being rendered as `'${xx}'`

Lists of comments in state returns

State functions can now return a list of strings for the `comment` field, as opposed to only a single string. This is meant to ease writing states with multiple or multi-part comments.

Beacon configuration changes

In order to remain consistent and to align with other Salt components such as states, support for configuring beacons using dictionary based configuration has been deprecated in favor of list based configuration. All beacons have a validation function which will check the configuration for the correct format and only load if the validation passes.

avahi_announce

Old behavior:

```
beacons:
  avahi_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```
beacons:
  avahi_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

bonjour_announce

Old behavior:

```
beacons:
  bonjour_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```
beacons:
  bonjour_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

btmp

Old behavior:

```
beacons:
  btmp: {}
```

New behavior:

```
beacons:
  btmp: []
```

glxinfo

Old behavior:

```
beacons:
  glxinfo:
    user: frank
    screen_event: True
```

New behavior:

```
beacons:
  glxinfo:
    - user: frank
    - screen_event: True
```

haproxy

Old behavior:

```

beacons:
  haproxy:
    - www-backend:
      threshold: 45
      servers:
        - web1
        - web2
    - interval: 120

```

New behavior:

```

beacons:
  haproxy:
    - backends:
      www-backend:
        threshold: 45
        servers:
          - web1
          - web2
    - interval: 120

```

inotify

Old behavior:

```

beacons:
  inotify:
    /path/to/file/or/dir:
      mask:
        - open
        - create
        - close_write
      recurse: True
      auto_add: True
      exclude:
        - /path/to/file/or/dir/exclude1
        - /path/to/file/or/dir/exclude2
        - /path/to/file/or/dir/regex[a-m]*$:
      regex: True
      coalesce: True

```

New behavior:

```

beacons:
  inotify:
    - files:
      /path/to/file/or/dir:
        mask:
          - open
          - create
          - close_write

```

(continues on next page)

(continued from previous page)

```

recurse: True
auto_add: True
exclude:
  - /path/to/file/or/dir/exclude1
  - /path/to/file/or/dir/exclude2
  - /path/to/file/or/dir/regex[a-m]*$:
regex: True
- coalesce: True

```

journald

Old behavior:

```

beacons:
  journald:
    sshd:
      SYSLOG_IDENTIFIER: sshd
      PRIORITY: 6

```

New behavior:

```

beacons:
  journald:
    - services:
      sshd:
        SYSLOG_IDENTIFIER: sshd
        PRIORITY: 6

```

load

Old behavior:

```

beacons:
  load:
    1m:
      - 0.0
      - 2.0
    5m:
      - 0.0
      - 1.5
    15m:
      - 0.1
      - 1.0
    emitatstartup: True
    onchangeonly: False

```

New behavior:

```

beacons:
  load:
    - averages:
      1m:
        - 0.0

```

(continues on next page)

(continued from previous page)

```

    - 2.0
  5m:
    - 0.0
    - 1.5
  15m:
    - 0.1
    - 1.0
- emitatstartup: True
- onchangeonly: False

```

log

Old behavior:

```

beacons:
  log:
    file: <path>
    <tag>:
      regex: <pattern>

```

New behavior:

```

beacons:
  log:
    - file: <path>
    - tags:
      <tag>:
        regex: <pattern>

```

network_info

Old behavior:

```

beacons:
  network_info:
    - eth0:
      type: equal
      bytes_sent: 100000
      bytes_rcv: 100000
      packets_sent: 100000
      packets_rcv: 100000
      errin: 100
      errout: 100
      dropin: 100
      dropout: 100

```

New behavior:

```

beacons:
  network_info:
    - interfaces:
      eth0:
        type: equal

```

(continues on next page)

(continued from previous page)

```
bytes_sent: 100000
bytes_recv: 100000
packets_sent: 100000
packets_recv: 100000
errin: 100
errout: 100
dropin: 100
dropout: 100
```

network_settings

Old behavior:

```
beacons:
  network_settings:
    eth0:
      ipaddr:
      promiscuity:
        onvalue: 1
    eth1:
      linkmode:
```

New behavior:

```
beacons:
  network_settings:
    - interfaces:
      - eth0:
          ipaddr:
          promiscuity:
            onvalue: 1
      - eth1:
          linkmode:
```

proxy_example

    - twilio_number: "+15555555555"
    - interval: 10
```

wtmp

Old behavior:

```
beacons:
  wtmp: {}
```

New behavior:

```
beacons:
  wtmp: []
```

New requisites available in state compiler

require_any

The use of `require_any` demands that one of the required states executes before the dependent state. The state containing the `require_any` requisite is defined as the dependent state. The states specified in the `require_any` statement are defined as the required states. If at least one of the required state's execution succeeds, the dependent state will then execute. If all of the executions by the required states fail, the dependent state will not execute.

watch_any

The state containing the `watch_any` requisite is defined as the watching state. The states specified in the `watch_any` statement are defined as the watched states. When the watched states execute, they will return a dictionary containing a key named "changes".

If the "result" of any of the watched states is `True`, the watching state *will execute normally*, and if all of them are `False`, the watching state will never run. This part of `watch` mirrors the functionality of the `require` requisite.

If the "result" of any of the watched states is `True` *and* the "changes" key contains a populated dictionary (changes occurred in the watched state), then the `watch` requisite can add additional behavior. This additional behavior is defined by the `mod_watch` function within the watching state module. If the `mod_watch` function exists in the watching state module, it will be called *in addition to* the normal watching state. The return data from the `mod_watch` function is what will be returned to the master in this case; the return data from the main watching function is discarded.

If the "changes" key contains an empty dictionary, the `watch` requisite acts exactly like the `require` requisite (the watching state will execute if "result" is `True`, and fail if "result" is `False` in the watched state).

onchanges_any

The `onchanges_any` requisite makes a state only apply one of the required states generates changes, and if one of the watched state's "result" is `True`. This can be a useful way to execute a post hook after changing aspects of a system.

onfail_any

The `onfail_any` requisite allows for reactions to happen strictly as a response to the failure of at least one other state. This can be used in a number of ways, such as executing a second attempt to set up a service or begin to execute a separate thread of states because of a failure.

The `onfail_any` requisite is applied in the same way as `require_any` and `watch_any`.

Basic Slots support in state compiler

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

Slot syntax looks close to the simple python function call. Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

Read more [here](#).

Cryptographic layer changes

M2Crypto is coming back. We are making the crypto backend modular but in this release M2Crypto is enabled if it's importable by Python. If not Cryptodome or PyCrypto is used as it was in the previous releases. M2Crypto is used in the same way as PyCrypto so there would be no compatibility issues, different nodes could use different backends.

NaCL Module and Runner changes

In addition to argument changes in both the NaCL module and runner for future removal in the Neon release, the default "box_type" has changed from `secretbox` to `sealedbox`. `SecretBox` is data encrypted using private key `sk` and `Sealedbox` is encrypted using public key `pk`.

utils functions reorganized into separate modules

The Salt utility functions from `salt.utils` (typically used by those developing extension modules for Salt) have been moved into different modules, grouped logically based on their functionality. The old function names will continue to work until the Neon release of Salt (due around Q1 2019).

The renamed functions are:

- `salt.utils.appendproctitle`: use `salt.utils.process.appendproctitle` instead.
- `salt.utils.daemonize`: use `salt.utils.process.daemonize` instead.
- `salt.utils.daemonize_if`: use `salt.utils.process.daemonize_if` instead.
- `salt.utils.reinit_crypto`: use `salt.utils.crypt.reinit_crypto` instead.
- `salt.utils.pem_finger`: use `salt.utils.crypt.pem_finger` instead.
- `salt.utils.to_bytes`: use `salt.utils.stringutils.to_bytes` instead.
- `salt.utils.to_str`: use `salt.utils.stringutils.to_str` instead.
- `salt.utils.to_unicode`: use `salt.utils.stringutils.to_unicode` instead.
- `salt.utils.str_to_num`: use `salt.utils.stringutils.to_num` instead.
- `salt.utils.is_quoted`: use `salt.utils.stringutils.is_quoted` instead.
- `salt.utils.dequote`: use `salt.utils.stringutils.dequote` instead.
- `salt.utils.is_hex`: use `salt.utils.stringutils.is_hex` instead.
- `salt.utils.is_bin_str`: use `salt.utils.stringutils.is_bin_str` instead.
- `salt.utils.rand_string`: use `salt.utils.stringutils.random` instead.
- `salt.utils.contains_whitespace`: use `salt.utils.stringutils.contains_whitespace` instead.
- `salt.utils.build_whitespace_split_regex`: use `salt.utils.stringutils.build_whitespace_split_regex` instead.
- `salt.utils.expr_match`: use `salt.utils.stringutils.expr_match` instead.
- `salt.utils.check_whitelist_blacklist`: use `salt.utils.stringutils.check_whitelist_blacklist` instead.
- `salt.utils.check_include_exclude`: use `salt.utils.stringutils.check_include_exclude` instead.
- `salt.utils.print_cli`: use `salt.utils.stringutils.print_cli` instead.
- `salt.utils.clean_kwargs`: use `salt.utils.args.clean_kwargs` instead.
- `salt.utils.invalid_kwargs`: use `salt.utils.args.invalid_kwargs` instead.
- `salt.utils.shlex_split`: use `salt.utils.args.shlex_split` instead.
- `salt.utils.arg_lookup`: use `salt.utils.args.arg_lookup` instead.

- `salt.utils.argspec_report`: use `salt.utils.args.argspec_report` instead.
- `salt.utils.split_input`: use `salt.utils.args.split_input` instead.
- `salt.utils.test_mode`: use `salt.utils.args.test_mode` instead.
- `salt.utils.format_call`: use `salt.utils.args.format_call` instead.
- `salt.utils.which`: use `salt.utils.path.which` instead.
- `salt.utils.which_bin`: use `salt.utils.path.which_bin` instead.
- `salt.utils.path_join`: use `salt.utils.path.join` instead.
- `salt.utils.check_or_die`: use `salt.utils.path.check_or_die` instead.
- `salt.utils.sanitize_win_path_string`: use `salt.utils.path.sanitize_win_path` instead.
- `salt.utils.rand_str`: use `salt.utils.hashutils.random_hash` instead.
- `salt.utils.get_hash`: use `salt.utils.hashutils.get_hash` instead.
- `salt.utils.is_windows`: use `salt.utils.platform.is_windows` instead.
- `salt.utils.is_proxy`: use `salt.utils.platform.is_proxy` instead.
- `salt.utils.is_linux`: use `salt.utils.platform.is_linux` instead.
- `salt.utils.is_darwin`: use `salt.utils.platform.is_darwin` instead.
- `salt.utils.is_sunos`: use `salt.utils.platform.is_sunos` instead.
- `salt.utils.is_smartos`: use `salt.utils.platform.is_smartos` instead.
- `salt.utils.is_smartos_globalzone`: use `salt.utils.platform.is_smartos_globalzone` instead.
- `salt.utils.is_smartos_zone`: use `salt.utils.platform.is_smartos_zone` instead.
- `salt.utils.is_freebsd`: use `salt.utils.platform.is_freebsd` instead.
- `salt.utils.is_netbsd`: use `salt.utils.platform.is_netbsd` instead.
- `salt.utils.is_openbsd`: use `salt.utils.platform.is_openbsd` instead.
- `salt.utils.is_aix`: use `salt.utils.platform.is_aix` instead.
- `salt.utils.safe_rm`: use `salt.utils.files.safe_rm` instead.
- `salt.utils.is_empty`: use `salt.utils.files.is_empty` instead.
- `salt.utils.fopen`: use `salt.utils.files.fopen` instead.
- `salt.utils.flopen`: use `salt.utils.files.flopen` instead.
- `salt.utils.fpopen`: use `salt.utils.files.fpopen` instead.
- `salt.utils.rm_rf`: use `salt.utils.files.rm_rf` instead.
- `salt.utils.mkstemp`: use `salt.utils.files.mkstemp` instead.
- `salt.utils.istextfile`: use `salt.utils.files.is_text_file` instead.
- `salt.utils.is_bin_file`: use `salt.utils.files.is_binary` instead.
- `salt.utils.list_files`: use `salt.utils.files.list_files` instead.
- `salt.utils.safe_walk`: use `salt.utils.files.safe_walk` instead.
- `salt.utils.st_mode_to_octal`: use `salt.utils.files.st_mode_to_octal` instead.

- `salt.utils.normalize_mode`: use `salt.utils.files.normalize_mode` instead.
- `salt.utils.human_size_to_bytes`: use `salt.utils.files.human_size_to_bytes` instead.
- `salt.utils.backup_minion`: use `salt.utils.files.backup_minion` instead.
- `salt.utils.str_version_to_evr`: use `salt.utils.pkg.rpm.version_to_evr` instead.
- `salt.utils.parse_docstring`: use `salt.utils.doc.parse_docstring` instead.
- `salt.utils.compare_versions`: use `salt.utils.versions.compare` instead.
- `salt.utils.version_cmp`: use `salt.utils.versions.version_cmp` instead.
- `salt.utils.warn_until`: use `salt.utils.versions.warn_until` instead.
- `salt.utils.kwargs_warn_until`: use `salt.utils.versions.kwargs_warn_until` instead.
- `salt.utils.get_color_theme`: use `salt.utils.color.get_color_theme` instead.
- `salt.utils.get_colors`: use `salt.utils.color.get_colors` instead.
- `salt.utils.gen_state_tag`: use `salt.utils.state.gen_tag` instead.
- `salt.utils.search_onfail_requisites`: use `salt.utils.state.search_onfail_requisites` instead.
- `salt.utils.check_state_result`: use `salt.utils.state.check_result` instead.
- `salt.utils.get_user`: use `salt.utils.user.get_user` instead.
- `salt.utils.get_uid`: use `salt.utils.user.get_uid` instead.
- `salt.utils.get_specific_user`: use `salt.utils.user.get_specific_user` instead.
- `salt.utils.chugid`: use `salt.utils.user.chugid` instead.
- `salt.utils.chugid_and_umask`: use `salt.utils.user.chugid_and_umask` instead.
- `salt.utils.get_default_group`: use `salt.utils.user.get_default_group` instead.
- `salt.utils.get_group_list`: use `salt.utils.user.get_group_list` instead.
- `salt.utils.get_group_dict`: use `salt.utils.user.get_group_dict` instead.
- `salt.utils.get_gid_list`: use `salt.utils.user.get_gid_list` instead.
- `salt.utils.get_gid`: use `salt.utils.user.get_gid` instead.
- `salt.utils.enable_ctrl_logoff_handler`: use `salt.utils.win_functions.enable_ctrl_logoff_handler` instead.
- `salt.utils.traverse_dict`: use `salt.utils.data.traverse_dict` instead.
- `salt.utils.traverse_dict_and_list`: use `salt.utils.data.traverse_dict_and_list` instead.
- `salt.utils.filter_by`: use `salt.utils.data.filter_by` instead.
- `salt.utils.subdict_match`: use `salt.utils.data.subdict_match` instead.
- `salt.utils.substr_in_list`: use `salt.utils.data.substr_in_list` instead.
- `salt.utils.is_dictlist`: use `salt.utils.data.is_dictlist`.
- `salt.utils.repack_dictlist`: use `salt.utils.data.repack_dictlist` instead.
- `salt.utils.compare_dicts`: use `salt.utils.data.compare_dicts` instead.

- `salt.utils.compare_lists`: use `salt.utils.data.compare_lists` instead.
- `salt.utils.decode_dict`: use `salt.utils.data.encode_dict` instead.
- `salt.utils.decode_list`: use `salt.utils.data.encode_list` instead.
- `salt.utils.exactly_n`: use `salt.utils.data.exactly_n` instead.
- `salt.utils.exactly_one`: use `salt.utils.data.exactly_one` instead.
- `salt.utils.is_list`: use `salt.utils.data.is_list` instead.
- `salt.utils.is_iter`: use `salt.utils.data.is_iter` instead.
- `salt.utils.isorted`: use `salt.utils.data.sorted_ignorecase` instead.
- `salt.utils.is_true`: use `salt.utils.data.is_true` instead.
- `salt.utils.mysql_to_dict`: use `salt.utils.data.mysql_to_dict` instead.
- `salt.utils.simple_types_filter`: use `salt.utils.data.simple_types_filter` instead.
- `salt.utils.ip_bracket`: use `salt.utils.zeromq.ip_bracket` instead.
- `salt.utils.gen_mac`: use `salt.utils.network.gen_mac` instead.
- `salt.utils.mac_str_to_bytes`: use `salt.utils.network.mac_str_to_bytes` instead.
- `salt.utils.refresh_dns`: use `salt.utils.network.refresh_dns` instead.
- `salt.utils.dns_check`: use `salt.utils.network.dns_check` instead.
- `salt.utils.get_context`: use `salt.utils.stringutils.get_context` instead.
- `salt.utils.get_master_key`: use `salt.utils.master.get_master_key` instead.
- `salt.utils.get_values_of_matching_keys`: use `salt.utils.master.get_values_of_matching_keys` instead.
- `salt.utils.date_cast`: use `salt.utils.dateutils.date_cast` instead.
- `salt.utils.date_format`: use `salt.utils.dateutils.strftime` instead.
- `salt.utils.total_seconds`: use `salt.utils.dateutils.total_seconds` instead.
- `salt.utils.find_json`: use `salt.utils.json.find_json` instead.
- `salt.utils.import_json`: use `salt.utils.json.import_json` instead.
- `salt.utils.namespaced_function`: use `salt.utils.functools.namespaced_function` instead.
- `salt.utils.alias_function`: use `salt.utils.functools.alias_function` instead.
- `salt.utils.profile_func`: use `salt.utils.profile.profile_func` instead.
- `salt.utils.activate_profile`: use `salt.utils.profile.activate_profile` instead.
- `salt.utils.output_profile`: use `salt.utils.profile.output_profile` instead.

Deprecations

Configuration Option Deprecations

- The `requests_lib` configuration option has been removed. Please use `backend` instead.

Profitbricks Cloud Updated Dependency

The minimum version of the `profitbrick` python package for the `profitbricks` cloud driver has changed from 3.0.0 to 3.1.0.

Execution Module Deprecations

- The `blockdev` execution module has been removed. Its functions were merged with the `disk` module.
- The `lxc` execution module has been changed as follows:
 - The `dnsservers` option to `lxc.cloud_init_interface` no longer defaults to 4.4.4.4 and 8.8.8.8.
 - The `dns_via_dhcp` option to `lxc.cloud_init_interface` now defaults to `True` instead of `False`.
- The `win_psget` module has been changed as follows:
 - The `psget.psversion` function was removed. Please use `cmd.shell_info` instead.
- The `win_service` module (which provides the `service` module on Windows platforms) has been changed as follows:
 - The `config` function was removed. Please use `service.modify` instead.
 - The following arguments to the `service.create` function have been renamed:
 - * `binpath` has been renamed to `bin_path`
 - * `depend` has been renamed to `dependencies`
 - * `DisplayName` has been renamed to `display_name`
 - * `error` has been renamed to `error_control`
 - * `group` has been renamed to `load_order_group`
 - * `obj` has been renamed to `account_name`
 - * `password` has been renamed to `account_password`
 - * `start` has been renamed to `start_type`
 - * `type` has been renamed to `service_type`
- The `nacl` module has been changed as follows:
 - The following arguments have been renamed in the `nacl.keygen`, `nacl.enc`, and `nacl.dec`:
 - * `key_file` has been renamed to `sk_file`
 - * `key` has been renamed to `sk`

Runner Deprecations

- The `manage` runner has been changed as follows:
 - `root_user` argument was removed from the `manage.bootstrap` function. Please use `salt-ssh` roster entries for the host instead.
- The `nacl` runner has been changed as follows:
 - The following arguments have been renamed in the `nacl.keygen`, `nacl.enc`, and `nacl.dec`:

- * `key_file` has been renamed to `sk_file`
- * `key` has been renamed to `sk`

State Deprecations

- In the `archive` state, the `tar_options` and `zip_options` options were removed. Please use `options` instead.
- The `cmd` state had the following changes:
 - The `user` and `group` options were removed from the following functions (please use `runas` instead):
 - * `cmd.run`
 - * `cmd.script`
 - * `cmd.wait`
 - * `cmd.wait_script`
- In the `file` states, the `show_diff` option was removed in all states where it was previously supported. Please use `show_changes` instead.

Grain Deprecations

- For `smartos`, some grains have been deprecated. These grains will be removed in Neon:
 - The `hypervisor_uuid` grain has been replaced with `mdata:sdcc:server_uuid`
 - The `datacenter` grain has been replaced with `mdata:sdcc:datacenter_name`

Pillar Deprecations

The legacy configuration for `git_pillar` has been removed. Please use the new configuration for `git_pillar` which was added in 2015.8.0, which is documented [here](#).

Utils Deprecations

- In `salt.utils.cloud`, the `fire_event` function now requires a `sock_dir` argument. It was previously optional.

Other Miscellaneous Deprecations

- In `version.py`, the `rc_info` function was removed. Please use `pre_info` instead.
- Warnings for moving away from the `env` option were removed. `saltenv` should be used instead. The removal of these warnings does not have a behavior change. Only the warning text was removed.

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Previously, support was added so that blackouts are enabled using a special pillar key, `minion_blackout` set to `True` and an optional pillar key `minion_blackout_whitelist` to specify additional functions that are permitted during blackout. This release adds support for using this feature in the grains as well, by using special grains keys `minion_blackout` and `minion_blackout_whitelist`.

Sentry Log Handler

Configuring sentry raven python client via `project`, `servers`, `public_key` and `secret_key` is deprecated and won't work with sentry clients > 3.0. Instead, the `dsn` config param must be used.

RAET transport

We haven't been doing development on RAET for quite some time and decided that 2018.3.0 is the time to announce the deprecation. RAET support will be removed in Neon. Please consider to move to `zeromq` or `tcp` transport instead of `raet`.

28.2.5 Salt 2018.3.1 Release Notes

Version 2018.3.1 is a bugfix release for *2018.3.0*.

Statistics

- Total Merges: 525
- Total Issue References: 74
- Total PR References: 255
- Contributors: 55 (Ch3LL, DmitryKuzmenko, Giandom, Kimol, L4rS6, LukeCarrier, OrlandoArcapix, TamCore, The-Loeki, UtahDave, aesposito91, bbinet, bdrung, boltronics, bosatsu, clan, corywright, damon-atkins, din-camihai, dmurphy18, dnABic, douglasjreynolds, dwoz, edgan, ejparker12, esell, ezh, femnad, folti, gareth-greenaway, gtmanfred, isbm, jasperla, johnj, mateiw, mcalmer, mirceaulinic, morganwillcock, opdude, pcn, pruiuz, psagers, psyer, rallytime, robinro, s0undt3ch, samodid, shengis, skjaro, tankywoo, terminalmage, twang-boy, vutny, yannj-fr, zmedico)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
file.mangaged:
  - source: salt://foo.conf
  - template: jinja
  - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own `json` or `yaml` filters:

```
/etc/foo.conf:
file.mangedaged:
- source: salt://foo.conf
- template: jinja
- defaults: {{ mydict | json }}
```

Tornado 5.0 Support for Python 2 Only

Tornado 5.0 moves to using asyncio for all python3 versions. Because of this and changes in asyncio between python 3.4 and 3.5 to only be able to use one ioloop, which requires some rearchitecting, support for tornado 5.0 and python3 versions of salt has been delayed to a later release.

For now, to use tornado 5.0, the python 2 version of salt must be used.

Changes to Slack Engine pillars

When using `groups_pillar_name` for the slack engine, the engine should be used as part of a salt-minion process running on the master. This will allow the minion to have pillars assigned to it, and will still allow the engine to create a LocalClient connection to the master ipc sockets to control environments.

Changes to Automatically Updating the Roster File

In 2018.3.0 salt-ssh was configured to automatically update the flat roster file if a minion was not found for salt-ssh. This was decided to be undesirable as a default. The `--skip-roster` flag has been removed and replaced with `--update-roster`, which will enable salt-ssh to add minions to the flat roster file. This behavior can also be enabled by setting `ssh_update_roster: True` in the master config file.

Changes to `file.blockreplace` State

The `append_newline` argument was added to this state. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

Note: This will require changes to your SLS if your `marker_end` does not include the very beginning of the content you want to keep.

See the `file.blockreplace` state documentation for further information.

Changelog for v2018.3.0..v2018.3.1

Generated at: 2018-06-06 17:43:01 UTC

- **ISSUE #47955:** (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
- **PR #47998:** (rallytime) Back-port #47989 to 2018.3.1 @ 2018-06-06 17:08:04 UTC
 - **PR #47989:** (dwoz) Properly decode password from aws using m2crypto (refs: #47998)

- 605463ca0d Merge pull request #47998 from rallytime/bp-47989
- 1b7e9ac2d3 Lint fixes
- 0545152ddd Properly decode password from aws using m2crypto
- **PR #47965:** (Ch3LL) Add PR 47924 from 2018.3 branch @ 2018-06-06 13:54:09 UTC
 - dbc798ac68 Merge pull request #47965 from Ch3LL/gitpy_mac_3.1
 - bf608abd44 Catch all exceptions in git import for salt.utils.gitfs
- **PR #47973:** (terminalmage) salt.modules.testinframod: fix TypeError invoking types.FunctionType @ 2018-06-06 13:53:46 UTC
 - 864d640633 Merge pull request #47973 from terminalmage/fix-testinfra
 - 4518c89484 Lint: Remove unused six import
 - c6816b2149 salt.modules.testinframod: fix TypeError invoking types.FunctionType
- **ISSUE #47236:** (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)
- **PR #47967:** (rallytime) Back-port #47957 to 2018.3.1 @ 2018-06-06 13:53:28 UTC
 - **PR #47957:** (garethgreenaway) [2018.8] Ensure x509 passphrase is a string (refs: #47967)
 - 5ddcff420 Merge pull request #47967 from rallytime/bp-47957
 - 9a55579af1 removing unnecessary change
 - 329b2e5956 Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.
- **PR #47902:** (Ch3LL) Remove In Progress for 2018.3.1 Release Notes @ 2018-05-30 18:26:49 UTC
 - 9c964fdbce Merge pull request #47902 from Ch3LL/rn_in_progress
 - f560a151cd Remove In Progress for 2018.3.1 Release Notes
- **PR #47897:** (Ch3LL) Add changelog to 2018.3.1 release notes @ 2018-05-30 15:04:42 UTC
 - ea7b4fdc08 Merge pull request #47897 from Ch3LL/rn_2018
 - e27ee273a7 Add == line to changelog line for release notes
 - 61e56d275d Add changelog to 2018.3.1 release notes
- **ISSUE #47784:** (jpsv) win_lgpo.py line 5368; AttributeError: 'OrderedDict' object has no attribute 'lower' (refs: #47848)
- **PR #47848:** (twangboy) Fix some major issues with the LGPO module @ 2018-05-30 13:37:32 UTC
 - f15e636d5e Merge pull request #47848 from twangboy/fix_47784
 - 98facf8dc8 Remove log.debug statement in __virtual__
 - f037fa4064 Fix some major issues with the LGPO module
- **PR #47881:** (gtmanfred) quote python_version in requirements.txt @ 2018-05-29 21:12:05 UTC
 - 92b8c4c08e Merge pull request #47881 from gtmanfred/2018.3.1
 - 3d874b5529 quote python_version in requirements.txt
- **PR #47874:** (gtmanfred) Tornado 5.0 is only supported on python 2 for now @ 2018-05-29 19:45:44 UTC
 - 705bf8172d Merge pull request #47874 from gtmanfred/2018.3.1
 - 13f920415a add tornado5 note to 2018.3.1

- aeacd2b749 allow tornado 5.0 to be installed only for python2
- **PR #47820:** (Ch3LL) Remove output_loglevel in mac_system module @ 2018-05-25 13:10:36 UTC
 - 09e8c5f0cd Merge pull request #47820 from Ch3LL/mac_system
 - 362414e53b Remove output_loglevel in mac_system module
- **PR #47798:** (rallytime) Back-port #47776 to 2018.3.1 @ 2018-05-23 15:10:43 UTC
 - **PR #47776:** (garethgreenaway) [2018.3] Fixes to failing _before_connect tests (refs: #47798)
 - 7e314c26c8 Merge pull request #47798 from rallytime/bp-47776
 - ae881547d2 Fixing unit.test_minion.MinionTestCase.test_beacons_before_connect and unit.test_minion.MinionTestCase.test_scheduler_before_connect.
- **PR #47782:** (rallytime) Back-port #47775 to 2018.3.1 @ 2018-05-22 20:56:37 UTC
 - **PR #47775:** (gtmanfred) catch UnsupportedOperation with AssertionError (refs: #47782)
 - 9c610da0bc Merge pull request #47782 from rallytime/bp-47775
 - bab9c966c5 catch UnsupportedOperation with AssertionError
- **PR #47770:** (rallytime) Back-port #47769 to 2018.3.1 @ 2018-05-22 17:27:20 UTC
 - **PR #47769:** (gtmanfred) skip test that breaks test suite (refs: #47770)
 - 4adf10b20b Merge pull request #47770 from rallytime/bp-47769
 - 3cfb95c7bc skip test that breaks test suite
- **PR #47724:** (terminalmage) 2 master_tops/ext_nodes fixes @ 2018-05-21 15:59:04 UTC
 - bbe8e62a98 Merge pull request #47724 from terminalmage/master_tops_fixes
 - 48b8c5acd1 Merge branch '2018.3.1' into master_tops_fixes
 - 89b3070d4c Change deprecation warning to debug logging
 - ceb6e10f87 Fix spurious "Malformed request" error
- **ISSUE #47484:** (whytewolf) Windows: pkg.latest state not updating packages. (refs: #47702)
- **PR #47739:** (rallytime) Back-port #47702 to 2018.3.1 @ 2018-05-21 15:37:03 UTC
 - **PR #47702:** (damon-atkins) State pkg.latest called win pkg.install with list of pkgs and the required versions (refs: #47739)
 - 97d6fe7434 Merge pull request #47739 from rallytime/bp-47702
 - f79da64bb0 Update is_windows path to use platform
 - f04b19b5b6 Ensure targeted_pkgs always contains value for non-windows.
 - 14659f9cad Adjusted based on feed back.
 - 9f18f7cdf5 Whitespace lint issues
 - 2a29b28ee6 pkg.install execution module on windows ensures the software package is installed when no version is specified, it does not upgrade the software to the latest. This is per the design. pkg.latest must provide the versions to install to pkg.install
- **PR #47730:** (rallytime) Back-port #47700 to 2018.3.1 @ 2018-05-21 15:36:16 UTC
 - **PR #47700:** (yannj-fr) fix roots modification time check (refs: #47730)
 - cfbe0ba73e Merge pull request #47730 from rallytime/bp-47700

- 9bc35b88ea fix roots modification time check
- **PR #47727:** (Ch3LL) Fix salt.utils.versions.warn_until spelling @ 2018-05-21 13:41:00 UTC
 - 3614d3d83a Merge pull request #47727 from Ch3LL/spelling
 - 47a8de5b73 Fix salt.utils.versions.warn_until spelling
- **PR #47736:** (Ch3LL) mac_utils test: patch __salt__['cmd.run*'] @ 2018-05-21 13:38:59 UTC
 - bb45cdaefe Merge pull request #47736 from Ch3LL/fix_util_mac_test
 - ee90c779a8 mac_utils test: patch __salt__['cmd.run*']
- **PR #47641:** (gtmanfred) fix _create_stream and tornado 5.0 @ 2018-05-18 14:25:36 UTC
 - 43930f8bac Merge pull request #47641 from gtmanfred/2018.3.1
 - 037fd92f59 fix pylint
 - 75d42d8963 Fix last test for tornado
 - a046512287 allow using tornado 5.0
 - 05e651f038 fix _create_stream and tornado 5.0
- **ISSUE #47532:** (edgan) roster auto-add feature in salt-ssh-2018.3.0 (refs: #47541)
